

when quality can't be compromised, turn to Gunze USA

We're one of the world's largest suppliers of analog-resistive touch panels, enabling the highest LCD visibility, providing exceptional durability and pinpoint accuracy. Our touch screens are used by discerning OEMs and companies worldwide that value technology leadership, customer service and quality.

Gunze USA world leader in analog-resistive touch panels.

Fulton Innovation's eCoupled wireless power technology in the car

on the same pad. That's where Fulton Innovation comes in.

The Michigan-based company has developed coils that can be embedded into tables and the like, so you'll eventually be able to power your blender, coffee maker, etc just by placing it on your kitchen counter. Bosch, the power tool manufacturer, and Texas Instruments have teamed up with the company and are working on building new products with the built-in coils.

Invisible cloak

A new metamaterial created by Rice University scientists could hide objects from human sight. By creating perfectly aligned dimples in a material,

the scientists channeled specific wavelengths of light from many directions into one uniform direction. Reflecting all the gathered light in one direction means that the nanoantenna acts like a mirrored magnifying glass, concentrating the light at a particular point. Unlike a magnifying glass, however, it doesn't matter what angle the light enters; it all goes to the same point.

The metamaterial is being claimed as the world's first 3D nanoantenna or an invisibility cloak. Its practical uses go beyond hiding things. For instance, solar collectors reflect light on a single point, but to work at maximum efficiency these must be mechanically tilted to stay in line with the sun as it moves across the sky. The nanoantenna would concentrate light on a single point without having to mechanically tilt it, eliminating one of the biggest costs involved in solar panels.

The world's thinnest material

Two UK scientists have been honoured with the prestigious *Europhysics Prize* for discovering graphene and also for their subsequent work to reveal its remarkable electronic properties.

The basic design of a new 3D metamaterial, which is lined with gold nanocups that re-direct the flow of light hitting an object. When the light is gathered and aimed away from the viewer's eye, the object appears invisible.
