Electronic newspaper from Plastic Logic

Graphene is only one atom thick, optically transparent, chemically inert and an excellent conductor. These properties make this material an excellent candidate for applications in various electro-optical devices that require conducting but transparent thin films—reveals the research by Professor Andre Geim and Dr Kostya Novoselov from the Centre of Mesoscience and Nanotechnology at the University of Manchester.

The team has also used graphene—the world's thinnest material—to create the world's smallest transistor which is only one atom thick and ten atoms wide. The researchers showed how a single graphene crystal can be carved into tiny electronic circuits with individual transistors not much larger than a molecule.

Plastic electronic newspaper

An electronic newspaper made out of plastic and no larger than a table mat will hit the market next year. This newspaper has been conceived by Cambridge University scientists who pioneered the idea of replacing silicon chips with plastic ones. It is being developed by Plastic Logic, a company based in Dresden, Germany.

The device is as light as a magazine. But onto it you can download hundreds of newspapers and—at the touch of a button—browse through them. With every part of the product, from the screen to the electronics, made of plastic, the newspaper is described by engineer Dean Baker as very robust.

Baker said the plastic newspaper could help address the problem of waste associated with traditional newspapers, as the information could be transmitted electronically and stored on a single e-reader.

Future of human-computer interface

The days of the mouse, keyboard and desktop graphical interface are numbered. Hollywood is showing what the future of human-computer interfaces is going to look like. The minute-long sequence in the film *Minority Report* in which Tom Cruise manipulated images on a screen using simple gestures has quickly become a cliché of future human-computer interfaces.

The success of the iPhone has already given rise to a new grammar of touch control, while multi-touch
