

stop() function:

```
<input type="Button" Value="Stop"
onclick="stop()">
```

This literally erases the sound.

The help() function provides on-screen help for the music player. It is invoked by:

```
<input type="Button" Value="Help"
onclick="help()">
```

The following line invokes the exit() function and prompts for an input for closing the window:

```
<input type="Button" Value="Exit"
onclick="exit()">
```

Program operations

To run the music.htm program, double-click this file. The program output of the music player is shown in Fig. 1. First, click the "Browse" command button. This will invoke a pop-up dialogue box, prompting you to enter the name of the music file. (A sample 'Audio' music file has been included in the EFY-CD for testing.) Click 'Play' button to play the music. You can hear the music from the speaker. If you don't hear the sound, one reason could be that you are

not running it on Internet Explorer. Close the program, right-click this file and open with Internet Explorer application.

The control panel is very small. Minimising the window pauses the music, while restoring the window resumes playback of the music.

You can also press 'Stop' to stop the music. Figs 2 and 3 show 'Help' button for operation and 'Exit' button to exit the application program, respectively.

Enabling the browser window to run JavaScript

Given below is the step-by-step procedure to enable the JavaScript plug-in:

1. When you launch the code (music.htm), it opens in Internet Explorer with a dialogue box (Information Bar) along with the message (refer Fig. 4). This is the time when the plug-in is disabled. Even if you click 'ok' button on the message and close the yellow bar on top, the player will not play any music.

2. Right-click the yellow bar, choose "Allow Blocked Content..."

and click 'Yes' in the succeeding dialogue box.

3. Now JavaScript is enabled and can be put to work. Every time, you have to repeat steps 1 and 2 to activate the plug-in.

4. You can also disable the warnings of the browser and launch the program directly without performing steps 1, 2 or 3 mentioned above. For this, you have to follow these steps:

(i) Open Internet Explorer and select 'Internet Options' from 'Tools' menu. It opens a dialogue box with 'General' as active tab

(ii) Click 'Advanced' tab and scroll down until you find 'Security' option with a lock icon yellow in colour.

(iii) Under 'Security', select the first two options by ticking the corresponding boxes

(iv) Now, open/run the music.htm program. It should open without any warning because JavaScript plug-in is enabled.

EFY note. The source code and other relevant files of this article have been included in this month's EFY-CD.
