

Bose SoundLink wireless music system

computer wirelessly. The system offers an AUX input for connecting other music sources like iPods, iPhones and CD/MD players. It requires no software or Wi-Fi connection and comes with a USB wireless key to stream music from the PC to the speaker. The system combines waveguide speaker technology and neodymium transducers to deliver

high-quality music.

Advantages and limitations

As the wireless MP3 players are targeted at the youth and the gymgoers, these may be an initial hit.

"The great advantage of a wireless headset is that there are

no wires to get tangled in.

You have more freedom and can even move away from the MP3 while continuing to listen to music. However, there are certain obstacles for a widespread deployment of wireless devices due to lack of awareness and the cost factor as they are comparatively more expensive than the wired ones. But as consumer awareness increases, the cost will decrease and this will increase the usage of wireless MP3

players," says John Mudie, general manager, CSR India

Says Singhal, "Wireless MP3 players fare very well. Their range is quite impressive. Even 25-30 ft away from the music system you will not experience any dropouts or decrease in audio quality. But these are, at present, compatible only with Windows, not with Linux or Mac. The devices are mostly USB 2.0 compatible." Singhal, however, feels much more thought needs to be put into the design of future models.

"Of course, there are drawbacks in design due to the lack of sample models to build upon, but there are also many strong points," states Mudie.

Concludes Moroda, "These devices are novel items. If there are any drawbacks, they will be ironed out. No new technology starts off perfectly, so it is understandable that there may be small flaws. But the response we are getting from the market is exciting." ●
