Corded headsets

GN Netcom has launched lightweight, sturdy and professional quality headsets for use in cost-conscious contact centres.

The Jabra GN1900 headsets feature a noise-canceling microphone, which filters out unwanted background noise, and PeakStop technology, which protects users from harmful sounds. The multiple adjustment points make these adaptable to individual preferences and the lightweight design ensures all-day comfort. The GN1900 QD variants have been designed for use with traditional desk telephones, however the future-proof design enables users to migrate to IP hard phones.

The GN1900 USB variants meet the increasing demand for cost-effective, professional VoIP headsets.

Vehicle tracking device

Visiontek has launched a high-performance GPS/GPRS vehicle tracking device that can track/monitor the vehicle status in real time. The device is available in two models, 84VT and 86VT. It can operate over a wide input voltage range (9V to 30V DC) and is quite easy to install.

Compact in size, the devices feature RS-232 compatibility, two-way voice and SMS communication, emergency calls through SOS switches for smooth operation, built-in battery, ignition status sensor, data storage for more than 80,000 locations, static navigation, on-line/offline tracking, remote configuration and LEDs for status indication.

TOOLS & EQUIPMENT

Pad-printing machine

Indus Engineering offers an economical pad-printing machine (Model FXP-1010-C) with a ceramic ring and magnetically sealed cup. The machine is equipped with a quick-changeover image plate to facilitate fast-changing jobs and continuously variable image transfer rate to accommodate different types of articles.

This closed-type machine is highly efficient, accurate and user-friendly. It features inductive proximity sensors for trouble-free working, auto fault-detection facility and dual-impression printing mode for translucent inks.

Drying systems for solar cell metallisation

Rehm Thermal Systems has launched an advanced series of drying systems for solar cell metallisation. The RDS 2100 and RDS 3000 offer a variety of advanced process features and thermal control that enable PV manufacturers to move their processes to an entirely new level of efficiency and yield. The drying process consists of a combination of either five or seven IR zones and one central convection zone. This design combination offers temperature profiling that can be adjusted for both precision and flexibility.

The systems guarantee a safe transport through the oven either via mesh belt or with pin chain up to three lanes. At belt speeds of up to 6 m/minute, these provide high throughputs of up to 5700 wph. A condensate residue management system controls the buildup of unwanted paste solvent and vehicle residue in the process chamber and extends the maintenance intervals.

Electronic load for DC power supply testing

Prime Electronics has introduced a feature-packed electric load (model EL 601) measuring only 14.5x25x25 cm³ and weighing 7 kg. It is designed for easy portability and saves valuable space on the test bench. All controls and displays are provided on the front panel for ease of operation. Multiturn load adjustment pot makes it very easy to precisely set the load. Separate voltage and current/power meters give
