

"We are known for polishing the knowledge base of engineers"

Embedded Technology Foundation, an embedded system and microcontroller training and consultancy company, with its specialised training programmes, is working incessantly to equip the professionals with the latest techniques to make them industry ready.

In conversation with Vanisha Joseph of EFY Bureau, Naveen Kumar, CEO, Emtech Foundation, shares more

Which training courses does Emtech Foundation provide? What is the value-add students and working professionals get by opting for your certifications?

Emtech Foundation has specialised training programmes in embedded systems for engineering students, freshers and working professionals, to equip them with the latest techniques. The courses we offer include:

Career Foundation Programme (CFP). This six-month job-oriented programme helps students pursuing their final year engineering courses, or fresh engineering graduates, upgrade their skill sets to match industry needs, providing 100 per cent job surety in core electronics companies.

Summer Training and Essence Programme (STEP). This six-week industrial training gives engineering students a feel of industrial work environment along with technical development.

Winter Rapid Action Programme (WRAP). It is a 15-day programme, specially designed for students with microcontroller knowledge, to give them practical exposure via projects.

Working Professional Programme (WPP). It covers training on 8/16/32-bit microcontrollers, embedded C programming, DSP and RTOS. We provide flexible timings for working professionals.

PCB designing programme.

How well equipped is your infrastructure to support these programmes?

Emtech Foundation is fully-

equipped with latest lab equipments, classrooms and a resourceful library. We have experienced faculty members. In addition, we invite industrial experts to deliver lectures. We also provide career counselling.

Please share details about the affiliation status of these programmes.

We are an ISO 9001:2000 certified company and provide certificates to students after successful completion of the training programme. Our certification is highly reputed and accepted in the industry.

Do you have any partnership with the industry to assist students in placements?

Yes, we do have partnerships with companies across telecom, energy metering and industrial electronics verticals. In the past, our students have been placed at ABB, Barco, Delphi, Pentair Water, BEL, STMicroelectronics, etc.

What is the scope of embedded system certified professionals in India?

At present, India exports embedded systems worth \$1 billion, which is expected to grow to \$5 billion within two to three years. India can also offer embedded system development services alongwith manufacturing and marketing embedded system solutions.

The domestic market has immense potential for growth in embedded systems sector, which means there are huge opportunities for professionals. More exposure

and hands-on training can help professionals achieve their goal of becoming experts and tap these opportunities.

What do professionals opting for self-learning route lose out on?

With engineering colleges mushrooming everywhere, students face less competition, resulting in lesser attention to fundamentals. For them, it becomes difficult to experiment with their knowledge.

Engineering colleges too are not able to provide right resources for their technical skills' development. Thus, to ensure success, students should choose the certification route over self-learning.

What skills should a professional aiming to become an embedded system expert, possess?

One should have a sound understanding of hardware design, microcontrollers/microprocessors, assembly/C Language programming and domain knowledge for which the embedded system needs to be designed. Exposure to PCB designing would be an added advantage.

Further, the industrial project is a part of every training module. Our courses make the students industry ready. As our motto is the technical upliftment of students, we also regularly conduct technical/robotics workshops at different colleges to make the students aware of the latest technologies. And today, we have become a trusted and resourceful embedded system training company. ■
