

# Path Learning Services: Laying The Career Path For You!

Path Infotech, a Noida-based learning service provider, has been building proficiencies in the IT domain through its certification programmes—both for young IT professionals at various learning/career stages, and corporates who want to train their workforce.

Albert Einstein once stated: “The only source of knowledge is experience.” From a training institution’s perspective, these words of wisdom carry a valuable insight. Undoubtedly, when the practitioners of technology impart knowledge, their experience too is passed on to the learners.

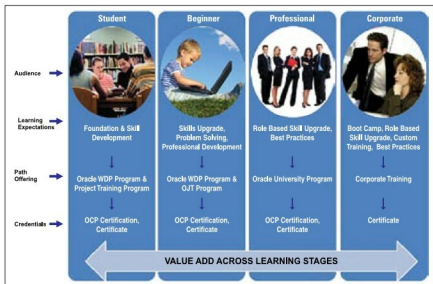

Path, an information solutions and services company, with about two decades of experience in consulting, enterprise solutions and system integration, offers precisely the same value proposition through its learning services.

“Path is not just a training institute. We are also technology solutions providers to businesses across the globe. Our services offer opportunities to young professionals to learn from industry leaders and practicing professionals—those who have tried, tested and invested time in mastering the prevalent technologies, and exploring new ones. This allows individuals to gain from their knowledge and experience, and become experts in their domains,” says Tarun Agarwal, director, Path.

“Path is not just a training institute. We are also technology solutions providers to businesses across the globe.”

—Tarun Agarwal, director, Path

Be it a student entering the IT industry, an IT professional with experience, or a corporate looking for a training booster shot to its employees, Path has something to offer to each one of them

Path offers various need-based skill enhancement programmes for the industry. Their learning services include programmes in corporate training, Oracle University training, Oracle Workforce Development, On-Job Training (OJT) and project training.

## Filling the gaps for students

Engineering and computer science students aspiring to enter the IT industry often lack skills and practical exposure. However, Path provides them an advantage in a demand-led market through its various programmes. For instance, the Oracle Workforce Development programme prepares students for desired job roles. Conducted on weekdays and weekends, this instructor-led training prepares aspirants for Oracle Certified Professional (OCP) programme—an established global bench-

mark for Oracle professionals.

Similarly, the project training programme of Path allows learners to undertake industrial project trainings, which is a part of their academic curriculum to make them industry ready. This programme includes instructor-led training on the latest technologies, hands-on practice sessions, software development projects, evaluations and appraisals. “The programme imparts trainings on different IT environments through a combination of instructor-led training and projects. It is specifically designed to build skills through problem solving and practicing in an actual software development environment. The participant acquires the latest technology skills to develop and manage applications in real-time systems for the technologies like Dot Net, Java and Oracle,” says Agarwal.
