POWER SUPPLY

Eco-friendly batteries

Sanyo Energy has launched eco-friendly AA-, AAA-, C- and D-sized 'eneloop' rechargeable batteries, universal charger and 'eneloop' solar light.

universal charger and 'eneloop' solar light.

The AA- and AAA-sized batteries provide longer power supply with increased storage capacity. These batteries are resistant to overheating. They are available in various pack options like AA- 2pcs blister card, AA- 4pcs blister card, etc.

The C- and D-sized batteries are also equipped with an overheating prevention function with a built-in current protection device (a positive temperature coefficient device). It protects against overheating and electrolyte leakage.

The universal charger has the ability to load a dozen 'eneloop' rechargeable batteries into the universal charger and, at the same time, monitor the voltage of each battery and prevent overcharging with the help of a built-in microcomputer.

The 'eneloop' solar light taps sunlight with Sanyo's HIT solar cell technology. It helps maximise the usability, portability and longevity of solar energy, made possible by built-in rechargeable battery.

TEST & MEASUREMENT

Smart in-line power meters

Raritan has added a new family of smart in-line power meters to its intelligent

rack power distribution and energy management portfolio. The Dominion PX-3000 series is targeted at data centres that want to easily add power, energy and rack environment data collection capabilities to stand-alone IT equipment or racks containing basic rack power distribution units (PDUs).

The four new Dominion PX-3000 in-line power meters, as well as all of Raritan's intelligent rack PDUs, come with built-in monitoring, security and networking capabilities. The in-line power meters are designed to be used in conjunction with dumb rack PDUs to provide strip-level metering and easily deployed environmental monitoring. The PX-3000 series is also intended to power stand-alone equipment.

The Dominion PX-3000 gathers extensive power information, including data on voltage, current, power factor, apparent power (kVA), active power (watts) and kilowatts per hour (kWh) energy consumption. It also provides room temperature and humidity information through optional plug-in sensors. The PX-3000 series is also fully compatible with Raritan's Power IQ energy management software.

COMPONENTS

Quad power management supervisor

Texas Instruments (TI) has introduced a new family of quad supply voltage supervisors (SVSs) with programmable delay and watchdog timer, which minimises board space in multi-rail power supply designs.

The TPS386000, TPS386020, TPS386040 and TPS386060 supervisors can monitor four power rails that are greater than 0.4 V with a threshold ac-

curacy of 0.25 per cent. This accuracy, combined with an integrated watchdog timer, provides system reliability for processor-based applications.

The TPS386000 family of devices offer an independent programmable delay input for each supervisor channel,

which can be set from 1.25 ms to 10 seconds for power supply sequencing.

The TPS386000 devices operate with a very low quiescent current of 12 μ A, which can help minimise system power consumption. They are designed for applications such as telecom infrastructure, networking, server/storage, industrial and analogue sequencing applications.

Pressure sensors for medical device industry

GE Sensing & Inspection Technologies has introduced the Nova Pressure Amplified (NPA) pressure sensor

series. Designed for the medical OEM industry, the series offers a fully signal conditioned sensor in a small outline integrated circuit (SOIC) package. Key applications include sleep apnea and respiratory monitors, anesthesia instrumentation and compression therapy equipment.

The series provides calibrated,
