

CIRSIM

MicroCAP

What's special?

The software comes with a multi-page hierarchical schematic editor, supports most PSpice, SPICE3 and many HSPICE commands and models. It has an IBIS model translator, integral circuit optimiser, integrated active and passive filter design function, PCB interface to popular packages, LAN version for collaborative projects, native digital simulation engine and device library with over 20,000 parts. Its other features include analogue and digital behavioural modeling, schematic waveform probing, dynamic on-schematic voltage/state, current, power, multidimensional parameter stepping, BSIM 1.0, BSIM 2.0, BSIM3, and BSIM4 MOSFET models, etc.

The competitors of this software are Intusoft, Simentrix and Pspice.

Users' feedback

Certain users feel that MicroCAP 9 can solve many problems that other software can't. It provides an interface to popular PCB layout tools so that schematics created within the software can be translated easily to netlist descriptions for the PCB programs. The software also has LAN support for collaborative projects.

Areas of improvement

Multi-threading is missing in the current version of the software. Inclusion

of this feature can speed up the operations. Its AC analysis sometimes gives varying results.

NL5 circuit simulator

The latest version of NL5, aka Non linear 5 Electronic Circuit Simulator, is 1.3 build 4. New builds of the software are released every month and the next version can be expected by January 2010.

What's special?

This software is user-friendly and fast. Its interactive simulation feature enables its users to pause, stop, edit components, change scales and crop graphs while a simulation is running. Users can also see results on graph. It has various components to choose from. It is not a Spice-based software, but can support more than 60 component types. NL5 provides HTTP links to popular development tools such as MATLAB, Python, etc.

Alexei, author of NL5, says: "The competitors of this software are PSIM and SIMetrix. NL5 should be considered as an addition to the popular packages such as LTSpice, Micro-Cap, etc, to solve problems that other tools cannot."

Users' feedback

The learning curve for this software is short. Users having worked on Windows won't face any problem using it. The selection of components is made by clicking on symbols and they are indexed on the basis of their names. NL5 network licence is free for educational institutions.

Areas of improvement

Neither it has SPICE-to-NL5 converter nor a guide to perform the task.

SolveElec

SolveElec is a software by PhysicsBox. The latest software version available is 2.5.

What's special?

SolveElec can be used to draw and analyse electrical circuits' functioning in direct or alternating current. It can be used to get literal formulae and values for current intensities and voltages defined in the circuit. The software can also be used to verify circuit-related equations, draw graphs and get equivalent circuit of the displayed circuit. SolveElec
