Arabic-speaking robot

Interactive Robots and Media Laboratory (IRML) of the United Arab Emirates University has developed the world's first Arabic-speaking humanoid robot named IbnSina. It uses novel face recognition, vision, speech solutions and other advanced technologies. It also uses and publishes online social information available on Facebook.

Named after the 11th century Islamic philosopher and doctor, IbnSina can answer a couple of questions and connect to the Internet to get information.

The speech of the robot is empowered by Acapela's new bilingual voice 'Nizar.' It sports a white cloak, golden-trimmed robe, a turban and grey beard.

Text reader for blind

Intel Corporation has developed Intel Reader, a tool that can assist people who have dyslexia or other specific

learning disabilities, or have vision problems such as low-vision or blindness. Intel Reader, about the size of a paperback book, converts printed text to digital text, and then reads it aloud to the user. Its design combines a high-resolution camera with an Intel Atom processor.

When used with Intel Portable Capture Station, it can store large amounts of text, such as a chapter or an entire book, for reading later.

Intel Reader has been endorsed by the International Dyslexia Association as an important advance in assistive technology.

A laptop on wheels

Mavizen, the manufacturing arm of TTXXGP, has announced the world's

Mavizen TTX02, world's first electric supersport motorcycle

first electric supersport motorcycle. It can be remotely diagnosed and tweaked by Mavizen if there's a need for modification.

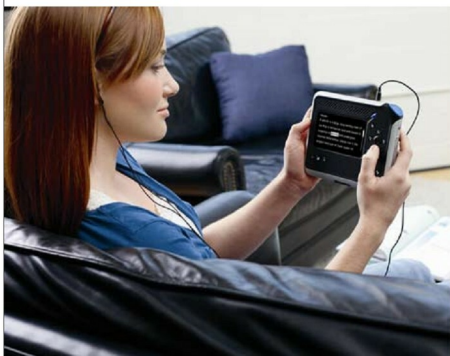

TTX02 is being billed not as a motorcycle but as a development platform, as it comes equipped with not only a chassis and drivetrain but also an open source Linux OS, Internet server, USB-based system bus (for open source engine management) and Wi-Fi connectivity.

This motorcycle also comes with dedicated IP access, enabling monitoring and tuning via integrated WLAN. It can also be connected via a WiFi-enabled laptop. The onboard IP connectivity also makes it easier for fledgling race teams to configure the motorcycle themselves.

TTX02 is expected to arrive sometime in the first quarter, next year onwards. Production will be limited to just 50 units at the outset.

A 3D book

Drake's Comprehensive Compendium of Dragonology is the UK's first book to use augmented reality technology, which allows readers to see a moving 3D image. The book contains the drawing of a European dragon on a particular page, which readers can see come to life from the pages of the
