Lights**

**BINAY LED-based MEDIUM INTENSITY
Aviation Obstruction Light Beacon**

As per the International Civil Aviation Organisation (ICAO) requirements for use on structures above 45m

Available in Low Intensity and Medium Intensity versions (as per the International Civil Aviation Organization guidelines), BINAY's patented LED Aviation Lights come with a 5-year warranty

LED Obstruction Lighting for:

- Industrial chimneys and smokestacks
- Transmission, microwave, and cellular towers
- Radio, TV and similar structural towers
- High-rise buildings and structures
- Airports and airfields

The BINAY LED Aviation Obstruction Light offers the following advantages:

- Fit-and-forget maintenance-free operation
- A long life of 100,000 hours (20 years at 12 hours daily burning)
- Pays for itself within a short period of operation in the form of reduced installation, maintenance and servicing costs
- Quick installation: Reliable operation 365 days per year
- Shock-proof and vibration-resistant
- Over-Designed Intensity to allow for natural LED intensity degradation over its operating lifetime

**THE BINAY LED OBSTRUCTION LIGHT IS UNDER ACCEPTED
PATENT, AND AS SUCH IS A PROPRIETARY PRODUCT**

How does 3D work?

There are two ways the 3D technology works: the traditional and the more recognised one—*anaglyph*, which uses colour filtered glasses to turn an otherwise blurry image into a 3D one. The process involves two images being superimposed over one another using two filters—one red and one blue. When you put the glasses on, the images are separated to give the illusion of depth.

The comparatively newer method doesn't require glasses—instead two separate images are projected on to a lenticu-

Finepix Real 3D W1 camera

lar screen, and as long as you look at the images straight on, the images give you 3D effect without any additional kit. This is the method that is usually used in 3D cameras and TVs.

Some people with certain eye conditions, however, may find it difficult to view 3D images. There are some issues with viewing the lenticular method for extended period of time, as it causes headache. Initially, it can be a little difficult to adjust to it when you see it without glasses.

Application areas

Of late, an increase in the 3D technology-enabled products as well as 3D films indicates how consumers' interest is being revived in the 3D technology. Philips was the first to launch a 3D TV in 2007 but Panasonic, LG, Samsung, Mitsubishi, Sony, etc, have also come up with 3D models. Consumer electronics brands are coming up with new applications, capturing 3D technology, in a move to give something new to the customers. Here are some of the new application areas using the technology.

Projector and monitor. View-

Sonic has recently launched a new series of 120Hz 3D-enabled projectors and 120Hz 3D LCD monitors.
