

ALERT MESSAGE UTILITY IN VISUAL BASIC (FOR UNATTENDED MAIL)

■ VEERANNA V.K. AND JANAKIDEVI S.J.

In your office, you might have to deal with a large number of letters moving in and out of your department. Though it is essential, it may not be possible for you to remember all of them by the dates for appropriate actions. As a result, many important letters might not be attended in time.

But don't worry, here we have a solution for you. It is possible to have a database in your PC with necessary program that shortlists letters based on the date of receipt, name of the sender and due date for reply (date of review). So you can attend to the letters based on their priority. The program alerts you by displaying a message about the records that are to be attended on that particular day.

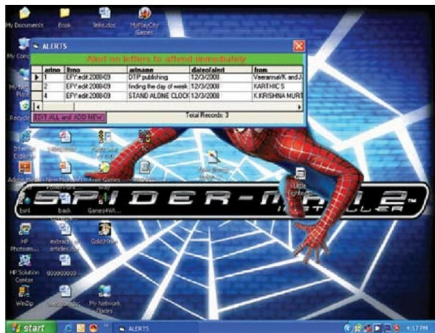

Here, we've used a Microsoft Access application to create the database with a few fields having names related to the items to be attended. You need to enter the date for reply (date of review) along with a few other details.

When you place the program in an appropriate directory of your computer, you will get an alert message as shown in Screenshot 1 soon after the operating system is loaded (or at the time of booting). By pressing 'yes' you can get further details as shown in Screenshot 2.

You can place the executable file of the program in two different locations to display the alert message at two

Screenshot 1: Alert message during system boot-up
