

Screenshot 5: Form design of alert message utility program

Screenshot 6: Property pages of the ADO control

Properties for Setting ADO Controls

Property	Set value
Name	Estado
Caption	Mainado
Command Type	2-adCmdTable
Cursor Type	2-adOpenDynamic
LockType	3-adLockOptimistic
Mode	3-adModeReadWrite
ConnectionString	Provider=Microsoft.Jet.OLEDB.4.0; Data Source=D:\offeditor\editor\office.mdb; Persist Security Info=False
RecordSource	editorfile → table name

of the Table. It is better if you use the same location and names. Otherwise, you will need to change these properties accordingly.

To set the property 'ConnectionString,' right-click the ADO control. You'll get 'Property Pages' as shown in Screenshot 6. Clicking 'build' will lead you to 'Data Link Properties' as shown in Screenshot 7. Locate your database by clicking 'Use Connection String' option. You have an option to test the connection. By doing so, you can verify the ADO connection to the database.

Next, click 'RecordSource' on 'Property Pages' screen. You can either enter the command type and the table name, or select from the options as shown in Screenshot 8.

We've also used datagrid control, which again is not a normal control. To get this, go to 'menu' bar, then select 'project' followed by 'components.' In the list of components, tick 'Microsoft DataGrid Control 6.0 (SP6) (OLEDB),' then 'apply.' It will appear in the controls area. Drag the control and place it onto the form. Resize it as shown in Screenshot 5. We've changed the following properties and left the other properties to default:

```
AllowAddNew → True
AllowArrows → True
TabAction → 2-dbggridNavigation
DataSource → estado
Visible → false
```

Save the form as 'alert.frm'.

Program code

The program code is designed in a very simple manner. You need to declare the required variables in the 'Option Explicit' section at the beginning of the code:

```
Option Explicit
Dim chkdate, alertdate As Date
Dim msgres As VbMsgBoxResult
Dim msgstr, tempstr As String
Dim total As Integer
```

The date of alert is calculated from the date of review in the form_load() event:

```
estado.Recordset.
```
