

TABLE XI
New Representation for Two- and Three-digit Numbers of the HdS

	New name	HdS	New name	HdS	
10	hexen	10	hexcent	100	100
20	zwei(e)n	20	zweicent	200	200
30	drei(e)n	30	dreicent	300	300
40	frei(e)n	40	freicent	400	400
50	pflei(e)n	50	pfleicent	500	500
60	Sexen	60	sexcent	600	600
70	hepsen	70	hepscent	700	700
80	Octsen	80	Occent	800	800
90	neunsen	90	neuncent	900	900
100	Tensen	A0	tencent	A00	100
110	Elfsen	B0	Elfcen	B00	110
120	twinsen	C0	twincen	C00	120
130	trinsen	D0	trincen	D00	130
140	frinsen	E0	frincen	E00	140
150	pfinsen	F0	pfincen	F00	150
1000	hexcent	100	taucen	1000	1000

The ekah taucen taucen is ekah hexillion in the HdS, whose poor cousin in the IDS is a dwarfed one million!

TABLE XII
New Representation for Decimal Numbers of HdS

IDS	HdS Old	HdS New
21.500	15.80	panchadashah dot ashtamah shoonyah
304.250	130.40	hexcent drei(e)n dot charutrah shoonyah
2479.734	9AFBC	Neuncen tensen panchadashah dot ekadashah tridashah

The IDS is used in science and business.

The RS is used for ornate numbering that has no mathematical or scientific implication.

The uniqueness of RS, however, is limited only to the first three numbers, viz, I as first, II as second and III as third. All others borrow decimal names and end in a common suffix '-th.' In counts like XXI, XXII and XXIII, and XXXI, XXXII and XXXIII, as each new decade commences, the uniqueness pops up as twenty-first, twenty-second and twenty-third, and thirty-first, thirty-second and thirty-third, albeit with decimal adjectives only to be forgotten again for the subsequent counts. However, each of XI, XII and XIII too ends in suffix '-th'

line as in IDS.

Category 2, system 2

The OS. The figures for the exclusive use of the octal system are right-slanted Indo-Arabic numerals in Garamond font, in italics. The equivalent of the decimal point in this system is comma instead of a point and written at the same place as the point. The octal numbers are read with a difference as indicated in Tables VI to VIII, i.e., the numbers are not read whole. Only small letters are used in words.

Category 2, system 3

The HdS. I have totally done away with the hybrid combination of symbols for the hexadecimal figures, viz,

only. Therefore one wonders why even all of them were not terminated in '-th,' be it twenty-oneth, thirty-twoth, forty-three, etc.

Category 2, system 1

The BS. A circle with a perpendicular diameter in it represents the absent (or nothing), while just the perpendicular diameter represents the present (or unity).

Standard specifications of null and unity: The 'O' is a perfect circle. It is advised to write it to a height equal to the block capital of the text font in which the figure would be used. And the erect or standing diameter of this circle perpendicular to the base constitutes the '1.' Decimal point is placed on the base

numerals coupled with alphabet because these two-tier figures are utterly confusing. And why shy away from designing a new set of numbers for the exclusive use of this system? The names for the single-digit figures of the HdS are borrowed from Sanskrit ending with alphabet 'h'—suggestive of hexadecimal counting. For digits greater than '2,' German names are given.

The single-digit hex numbers retain their old format for the first ten figures. There is no change in face value for each of them in either of the systems, viz, the IDS and the HdS. So '0' to '9' are the old guard figures themselves in both the systems. From 'A' of hex (i.e., 10) to 'F' of hex (i.e., 15) we encounter the first six double-digit figures of the IDS which are single-digit figures of the HdS.

In Table X, the set has been prepared so as to act as our subconscious reference in IDS. It also indicates that we are still in the single-digit domain of the HdS.

In Table XI, the double-digit hex numbers from hexen till pfinsen terminate with the suffix '-sen'—indicative of tens of the decimal counting (two-digit era). From here onwards the road is paved automatically. All the three-digit numbers terminate with a suffix '-cent.'

Four-digit and higher hex numbers are not difficult to comprehend. The lowest of the four-digit hex reveals itself in a familiar note 'taucen':

1000 ekah taucen
10000 hexen taucen
100000 ekah hexcent taucen
1000000 ekah taucen - the hexillion

The counterpart of the decimal point is called the 'dot' in the HdS and is written at the top upper end instead of at the bottom base end:

5'80
130'40
9'78'18
