

The new product, measuring only 6.5mm thick, is thinner than any other existing TV set, and even slimmer than most mobile handsets. Its thickness is one seventh of Samsung's Bordeaux 850 LCD TVs, which are currently the thinnest on the market, the company said. The TV uses a light-emitting diode backlighting system.

World's fastest graphene transistor

IBM researchers recently demonstrated the operation of graphene field-effect transistors (FETs) at GHz frequencies and achieved the highest frequencies reported so far using this novel non-silicon electronic material. This accomplishment is an important milestone for the Carbon Electronics for RF Applications (CERA) programme sponsored by DARPA, as part of the effort to develop the next-generation of communication devices, IBM said.

Graphene is a special form of graphite, consisting of a single layer of carbon atoms packed in honeycomb lattice, similar to an atomic scale chicken wire. Graphene has attracted immense worldwide attention and activities because its unusual electronic properties may eventually lead to vastly faster transistors than any transistors achieved so far. A key advantage of graphene lies in the very high electron speed with which electrons propagate in it, essential for achieving high-speed, high-performance transistors.

The IBM team found that the operation frequency increases with diminishing device dimension and achieved a cut-off frequency of 26 GHz for graphene transistors with a gate length of 150 nm—the highest frequency obtained for graphene so far.

World's first 6.4cm drive for DVRs

Seagate has added two more products to its Pipeline HD family of purpose-built hard drives for digital video recorders (DVRs): HD Mini and HD.2. The HD Mini hard drive, according to the company, is the world's first 6.4cm (2.5-inch) drive engineered specifically for use in DVRs. It is available in 160GB and 250GB capacities.

The HD.2 comes in an 8.9cm (3.5-inch) form factor. Available in 250GB, 500GB and 1TB capacities, it gives home entertainment device manufacturers one- and two-disk, cost-optimised solutions for today's high-definition video recording applications.

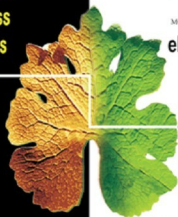

Both the HD.2 and HD Mini hard drives are made up of 50 per cent recycled materials with 75 per cent of the materials being recyclable. These drives also achieve a 52 per cent improvement in power savings over previous generations.

The drives will be available in the first half of 2009.

Fastest graphics supercomputer

AMD is developing a new supercomputer called Fusion Render Cloud that will break the one petaflops barrier, and
