

KEPTRON

The House of Power Technology

AN ISO 9001:2000 CERTIFIED COMPANY

DOUBLE CONVERSION

PURE SINE WAVE

Online UPS

- 1 KVA to 100 KVA
- Latest State-of-the Art PWM Controlled IGBT Based design
- High efficiency and reliability
- Low cost

OTHER PRODUCTS

- LINE INTERACTIVE UPS (DC 12V to 48V) : 500VA to 3 KVA
- INVERTER (SINE-WAVE) : 300 VA to 50 KVA
- HOME UPS : 300 VA to 3 KVA
- SERVO STABILIZERS : 2 KVA to 500 KVA
- Battery Charger (SMPS)

Seagate HD Mini hard drive

process a million computing threads across more than 1000 graphics processors. The company anticipates it to be the fastest graphics supercomputer ever. The supercomputer will be powered by OTOY's software and make high-definition (HD) cloud computing a reality. AMD plan to have this system ready by the second half of 2009.

The system will enable content providers to deliver video games, PC applications and other graphics-intensive applications through the Internet 'cloud' to virtually any type of mobile device with a Web browser without making the device rapidly deplete battery life or struggle to process the content.

It will transform movie and gaming experiences through server-side rendering – which stores visually rich content in a computing cloud, compresses it and streams it in real time over a wireless or broadband connection to a variety of devices such as smart phones, set-top boxes and ultra-thin notebooks. By delivering remotely rendered content to devices that are unable to store and process HD content due to such constraints as device size, battery capacity and processing power, HD cloud computing represents the capability to bring HD entertainment to mobile users

virtually anywhere.

Windows 7 vs Vista

The beta version of Microsoft's latest operating system Windows 7 has just been released. Said to be a better version of the Windows Vista, it promises to improve the user interface and memory management apart from offering a faster boot-up time. It is 20 per cent faster than the Vista and takes 27 seconds to boot-up, which is almost the same as offered by the Windows XP. The shutdown time is also lesser than what is being offered by other operating systems in the market today.

You don't have to wait too long as the download and transfer time for files is much less on a dual-core Intel processor. The 1GB RAM is also much faster on a Windows 7 than the Vista and XP.

Efficiency is probably what makes the difference. "While Vista emphasised on style over substance, Windows 7 emphasises on efficiency over sizzle and flexibility," says Frost & Sullivan deputy director (ICT practice) Kaustubh Dhavse.

One IP world

Tata Communications has announced the launch of One IP World, which will function as an interactive forum fostering dialogue pertaining to IP and Voice over IP (VoIP). Launched publicly at the 2009 Pacific Telecommunications Council (PTC) Annual Conference, in Honolulu, Hawaii, One IP World is an open resource for telecommunications professionals allowing the exchange of business and technical information on challenges associated with IP converged communications.

One IP World will also feature regular contributions from high-level Tata Communications' executives discussing VoIP peering, IP issues and trends as well as their knowledge and expertise on IPv6.
