

(From L to R) Ed Granger-Happ, CIO, Save the Children and chairman of NetHope, explains the features of the Intel-powered classmate PC to Carolyn Miles, COO of Save the Children, and Intel chairman Craig Barrett, at the International Consumer Electronics Show (CES) in Las Vegas. Intel is teaming up with Save the Children and Kiva.org on a year-long global campaign called the 'Small Things Challenge' to raise awareness and money to educate kids and help their parents in developing nations

ing to Steve, the computer will be able to 'hear' and 'see,' besides recognising gestures.

Intel

Intel's chairman Dr Craig Barrett chose to speak at length on 'Small Things Challenge' (instead of processors) in his keynote address. This project is being run together with Kiva.org to raise money for Save the Children's programme titled 'Rewrite the Future.' The plan is to urge the people worldwide through 'smallthingschallenge.com' website to help in development and education of children in emerging countries.

Barrett unveiled the third generation of low-cost Classmate PC tablet for use in schools in developing countries. Also, a video was shown to demonstrate how low-cost solutions were

being found in India to take education to villages in buses fitted with computers, and to provide healthcare facilities in remote areas using telemedicine techniques.

Barrett, however, believes that we shall continue to be surrounded by screens, including the large TV, medium-size computer and small-size hand-held displays, for a long time. Anyone who thinks that there won't be these three predominant screens or devices in the near future is crazy, according to him.

Sony

Sony's chief executive Sir Howard Stringer showed a thin, flexible, coloured OLED screen which could be bent. He also showed the audience a couple of short futuristic digital 3D movie clips with the help of sunglasses

which had polarised lenses made by RealD.

Since the technology for screening 3D movies is complicated, it is not likely to be available for showing at home theatres. So 3D movies are once again expected to drive the viewers to the theatres for this new kind of realistic experience. DreamWorks Animation's chief executive Jeffery Katzenberg disclosed that their company had already retooled their studio to make 3D movies, and from this year they would be making 3D movies only.

Stringer pulled out the prototype of a Vaio 'Lifestyle PC' from his pocket which he said was as thin as a pack of playing cards and weighed just 640 gm. It has a 20cm (8-inch) display but full capabilities of a standard notebook, unlike the smaller netbooks being offered
