2	nos	3	33	unchecked
2	nos	4	34	unchecked
2	nos	All	35	—

nothing but the version of MS Office installed in your system.

A common dialogue control is also used in the program. So select 'components' from 'project' menu, tick the box against Microsoft Common Dialog Control 6.0 and click 'ok' button.

Place one command button on the form at the bottom, resize and position it as shown in Screenshot 2 and change the name property to 'Page1'. The shape of the command button is designed using MS Paint application and saved as the page1.bmp file in your system. Then create a control array of it (copy-and-paste procedure) and place three more command buttons as shown. Change the picture property of each button to 'bitmap' and select associated bmp files similar to the first button's page1.bmp file.

Since menus are used in the article, these can be added on the form as shown in Screenshot 3. To add a menu item, select 'menu editor' from 'tools' menu and you will get the menu editor screen as shown in Screenshot 3. Add the first menu item as shown, type 'file' in the caption property and 'filemenu' in the name property, leave the index property blank and tick the boxes against 'enabled' and 'visible' options. Use right arrow mark in the menu editor to add pull-down menu or sub-menu items.

A 'numdummy'

menu is used as a pop-up menu with its index option as blank. Note that if the index property of the parent-level menu item is left blank, either it allows use of pull-down/sub-menu items as separate click events if the name property is different or as pop-up menu if the name property is the same (observe the table). Similarly, add all other main menu and sub-menu items, change their captions, names and indices and enable as listed in the table.

Some important properties of the controls used in the project are:

```
Form formdtp
BackColor = &H00C0C0C0%
BorderStyle = 1 'Fixed Single
Caption = " "
ControlBox = 0 'False
MaxButton = 0 'False
MinButton = 0 'False
```

```
CommandButton BACK
BackColor = &H0000FF00%
Caption = "PASTE BACK"
Style = 1 'Graphical
Label Label1
Alignment = 2 'Center
BackColor = &H00FFC0FF%
Caption = "Pages"
Label Label2
Alignment = 2 'Center
Appearance = 0 'Flat
BackColor = &H0000FFFF%
BorderStyle = 1 'Fixed Single
Caption = " WORD PAGE BEHIND "
OLE OLE1
AutoActivate = 1 'GetFocus
BackColor = &H00E0E0E0%
Class = "Word.Document.8"
Enabled = 0 'False
OLETypeAllowed = 1 'Embedded
SizeMode = 1 'Stretch
TabIndex = 0
Verb = 1
Shape Shape1
BorderColor = &H00FF0000%
BorderWidth = 4
FillColor = &H00FFC0FF%
FillStyle = 0 'Solid
Shape Shape2
BorderWidth = 2
Visible = 0 'False
```

After setting all the desired properties, the output form of the program will appear as shown in Screenshot 1.

Program code

We have chosen 'mywordapp' object to work with MS Word application. The 'thisdoc' document object is used to work with the new or existing document, 'thisrange' object to work with the selected range (one page or several pages) in the document, and 'myview' object to view a select page or pages in the active window. These objects together with OLE object and their associated properties are used throughout the program at several places to meet the requirements. In order to use these objects, you have to set the objects to the required information.

The code for the MS Word
