minutes depending on your system specifications.

Once the installation is done, the PC will restart, and once again you will be greeted by the same screen as shown in Fig. 6. Again, select Ubuntu and now you are in! This time, you will be greeted by a typical Ubuntu log-in window (Fig. 8), where you will have to enter your username and password—hope you still remember them.

Now, you have Ubuntu GNU-Linux running on the same machine (Fig. 9). So, was it difficult?

Something important now: you will be able to see other partitions under 'Places → Computer,' located on the top menu bar of your Ubuntu screen. Remember, if you want to save any data, save it only on these partitions that are also accessible through Windows. If you save anything on the Ubuntu desktop, you will not be able to see it in Windows.

I understand the user interface of Ubuntu is quite different from what you're used to in Windows, but hey, it's just a matter of time before you get used to this one too.

You can read more about how to install software in Ubuntu and many other things at 'help.ubuntu.com.' The URL has everything that a new user requires, written in plain text. So, what are you waiting for; get started with GNU-Linux.

Uninstall

If you plan to install Ubuntu from Windows because you want to go for an independent Ubuntu installation, go to the Windows Control Panel and under the 'Add/Remove Software' section, you can find Ubuntu. Uninstall it the way you uninstall any other software (Fig. 10). But remember, save all your data only on the other partitions of Windows, so you can use that data even after you have completely removed Ubuntu from your machine. ●
