

Test V-I Signatures in a jiffy

QNimits

QT15 V-I Signature Tester

Key Features :

- Unique Trouble-shooting Tool
- Nodal Impedance Test
- Save & Compare Facility
- Data Transfer to PC through USB Port (Optional)
- In-built Color LCD TFT Screen
- Truly Portable Unit

Ideal for :

- Electronics Repair Shops
- Field Engineers & Technicians
- In-house or Third Party Service Centres
- Recovery of Failed Boards in Manufacturing Process

Dealership / Stockist enquiries are welcome.

stuff, i-Sobot's movements are phenomenally lifelike.

Car key that prevents mobile use while driving

Researchers at the University of Utah have come up with an automobile ignition key that prevents teenagers from talking on mobiles or sending text messages while driving. The invention is called Key2SafeDriving and aimed at cutting down on road deaths. It relies on Bluetooth technology to wirelessly connect keys to phones.

The system includes a device that encloses a car key—one for each teen in the family. The device connects wirelessly with each key user's mobile via either Bluetooth or RFID (radio-frequency identification) technologies.

To turn on the engine, the driver must either slide the key out or push a button to release it. Then the device sends a signal to the driver's mobile, placing it in 'driving mode' and displaying a 'stop' sign on the phone's screen.

While in driving mode, teen drivers cannot use their mobiles to talk or send text messages, except for calling 911 or other numbers pre-approved by the parents. Incoming calls and texts are automatically answered with a message saying, "I am driving now. I will call you later when I arrive at the destination safely."

Tiny sensor detects cancer-causing molecules

US scientists have developed a tiny sensor that can detect small amounts of cancer-causing toxins or trace the effectiveness of cancer drugs inside living cells. The finding, reported in the journal *Nature Nanotechnology*, offers a new tool for tracking specific chemicals in the body.

"It's much smaller than a living cell in your body," said Michael Strano of Massachusetts Institute of Technology in Cambridge, who worked on the study.

For its sensors, Strano's team wrapped carefully shaped carbon

nanotubes with DNA, which offers a binding site for DNA-damaging agents inside cells. The sensors give off a fluorescent light that can be detected in the near-infrared light spectrum. Because human tissues do not light up in this spectrum, the nanotubes stand out.

Strano said the light signal changes when the sensors interact with DNA inside cells. These changes can help them identify specific molecules.

Biodegradable PC

The world's first biodegradable computer, the iameco, has been invented by Jimmy Devins in Dublin. It is manufactured from wood panels made from waste products in the lumber and pulp industry.

In addition to the iameco com-

iameco computer made from wood panels

puter, which uses one-third less energy than conventional PCs, the wood can be used to manufacture the computer monitor casing, keyboard and mouse.

Your own personal supercomputer

Now you can experience cluster-level computing performance—up to 250 times faster than standard PCs and workstations—right at your desk. Named Tesla, this personal supercom-
