

Analog Devices India

We have to catch up with China and Taiwan

With the Indian design industry expected to grow ten times over the next ten years, India is emerging as a major design centre for integrated circuits (ICs) and systems-on-chips. India's position as a design centre as well as vast market is so strong that it will soon drive some of the major global developments in the semiconductor industry.

We hope to see improvement in the economy by mid 2009 and the recovery, though slow, would surely happen. Globally, the semiconductor industry and worldwide market for semiconductors have matured and appear headed for a single-digit growth in the coming years compared to the double-digit growth of yesteryears. However, the scene in the Indian semiconductor industry is different. The rising middle-class income has created a huge market for semiconductor-intensive products and we may see this trend to continue for some more years to come.

Also, while there is an increasing upsurge in manufacturing activities in India over the last few years, especially in the telecom, consumer and industrial segments boosted by sub-contract manufacturing activities, India still has a long way to go in catching up with countries like China and Taiwan that are today the manufacturing hot-spots in Asia.

We at Analog Devices India (ADI) believe that we can play an important role in helping India to grow a complete ecosystem for electronics equipment. This includes semiconductor design, test and production, software development, electronics equipment design and manufacturing, and consumer and enterprise application of electronics equipment to improve the quality of life.

DELL India

2009 will be an interesting year for the Indian PC market

While forecasts across the globe have been rather low for the growth and adoption of PCs and notebooks, India displays a positive trend. We will see notebooks becoming the first choice for many PC buyers this year and there will be emphasis on certain features such as WiFi, big screen size, higher download speeds as well as mobility. Netbooks will make their presence felt and those who are looking at basic access to the Internet will choose them over the normal PCs. Longer battery life will also be an important factor.

2008 was an important year for the consumer segment in India, creating a huge market for players in this segment. Some of the key trends driving this market are the focus on mobility and personalisation.

The number of business and IT professionals is also growing fast and the companies are well prepared to tap into

this opportunity. The need today is for machines that are thin, light and easy to carry around and offer high security features. The SME segment is also growing, which means demand for more hardware, along with software, to cater to their needs.

As 2008 winds down, Dell is well positioned across the board to take share away from its competitors with its strategy of meeting customer needs, reducing operational expenses and leveraging its traditional strengths to help customers hone their competitive edge. Trends that will help Dell add value to its customers in 2009 are iSCSI-based storage, embedded virtualisation, data centre efficiency and cloud computing.
