

Delta India

India has an excellent opportunity to become a world player

The Indian market for electronics products is growing at about 30 per cent per annum. What is really putting India on the world map today is not better and faster growing revenue figures but innovation in electronics design of a revolutionary nature. India has a huge pool of highly talented and educated engineers in the tech sector with lots of potential to revolutionise technology.

Local manufacturing has to keep pace with the growing local demand and with the kind of talent pool available in India, it is not a dream that the Indian industry will cross the \$40 billion mark by 2010.

The electronics industry in India constitutes just 0.7 per cent of the global electronics industry. Though miniscule by international comparison, India is already an exporter of a vast range of electronic components and products for various applications like telecom equipment, display technologies, entertainment electronics, optical storage devices, passive components, electromechanical components, transmission and signalling equipment, semiconductor designing and elec-

tronic manufacturing services (EMS). With this kind of positive developments taking place in the industry, India has an excellent opportunity to become a world player.

In threat lie opportunities. Though the economic downturn will have an impact on the electronics industry, with the government support and huge domestic market available, the industry will be able to cope up with the situation. I believe that we will rise over the crisis like a resurgent Phoenix and come out much stronger.

The growth in demand for telecom products has been breathtaking. With telecom penetration of around 10 per cent, this growth is expected to continue at least over the next decade.

Delta, being a provider of telecom power supply systems, has lots to contribute to the growth of the Indian industry, especially the forthcoming rural telephony expansion plan.

Freescale India

We should design and manufacture global products

The consumer electronics industry has been impacted by the financial crisis, which, in turn, has impacted the semiconductor industry. According to a recent KPMG survey, 33 per cent of the global semiconductor players said profits would be flat while 26 per cent said these would be volatile and unpredictable. Another 15 per cent said profits would decline.

Having said that, the growing demand for better energy management, better healthcare and energy conservation is expected to increase adoption and growth in the market despite the downturn. Also, India will prove to be a good investment destination as its 350 million people with purchasing power cannot be ignored. Today OEMs, design houses and semiconductor companies are looking at creating products for the masses and as the ecosystem evolves, companies will be able to build complete solutions in India

for the Indian market.

The industry will continue its growth march in the future but the growth will come from newer technology products that offer improved performance at affordable prices. Also, India is at a junction where we should now focus on designing and manufacturing global products and then reach out to other emerging markets. To a large extent, this has already started.

Freescale India is committed to the Indian market. As a part of our corporate strategy, we play in all aspects of the embedded space and will continue to support the development of next-generation solutions for these markets to enable customers to have leading-edge and differentiating products.
