

Tata Elxsi

Engineers need to apply their knowledge to benefit society at large

S. Jagannathan, Head of Technology Innovations, Tata Elxsi

With India emerging as the fastest growing telecom market, it is not surprising that chipmakers are honing their skills in this space. India's electronics industry is growing five times faster than the global electronics communication market, and as the demand for technology increases each day, India's design engineers are well set to embrace this opportunity.

However, Indian engineers need to apply their knowledge of chip and embedded system design to benefit society at large, especially the poor, and in application areas such as agriculture, flood control and medical services. The vast talent that India has in embedded systems must move beyond merely finding applications in cars and mobile handsets, for instance, and be of use in the lives of common people.

The Indian industry should concentrate on the domestic requirements for ICT and IT applications, ranging from training and education, healthcare to e-governance. Presently, companies are too involved with the export market for IT and ICT services. Development of applications in

local language could be one area and IT-based education delivery could be another.

The debt-to-GDP ratio in the USA, the UK and European countries is in high range of 200 to 250 pc while in India it is just 60 pc. This makes us pretty immune to the crisis of similar nature that Western countries are facing. Another point in favour of India is the increasing give and take between cities and rural areas.

With development centres in India and Japan and offices in other countries, Tata Elxsi has over the years evolved as one of the best centres for the design and development of embedded systems and software. We are leveraging our wireless engineering competence to address the emerging standards such as mobile WiMax, LTE, HSPA and IMS by developing efficient protocol and system solutions in this space.

Siemens Enterprise Communications

Communication technologies that help enterprises to cut down costs will be in demand

Anil Jain, vice president, Asia Pacific, Siemens Enterprise Communications

The enterprise telephony market has had a steady growth rate of more than 22 per cent year-on-year. It has evolved from a plain telephony market to a full-blown IP-based converged communication market. Today, enterprise telephony infrastructure is not just a make-a-call infrastructure but a key element of the enterprise business process. The technology is changing rapidly with newer features and tools to reduce the operating and ownership costs for an enterprise.

With the increase in IP penetration and free availability of IP bandwidth, convergence of voice, video and data would create a larger demand for newer state-of-the-art

converged telephony platforms with integrated tools to handle unified presence based applications with full integration to the user desktop.

Communication technologies that help enterprises to cut down operative and ownership costs will be in demand and hence there is large potential in spite of the economic slowdown. As a provider of IP-based converged communication solutions, Siemens brings in the latest technology customised to the needs of the Indian enterprises backed with a 24x7 service support.
