The Indian PC market is still promising

The Indian PC market is the fourth largest in the Asia-Pacific region after China, South Korea and Australia. We foresee a great business potential for computer manufacturers in India. The Indian IT sector has been growing exponentially and there is a rising demand for employment in that sector. Though the industry is currently facing a slowdown, it will soon pick up and we see a tremendous potential in the growth of the industry.

The companies which are flocking to India to tap the market are rightly justified. In fact, the total shipment of PCs had already crossed 6.5 million units in 2007, thereby recording 20 per cent year-on-year growth in unit shipments. Of these, notebook PC shipments accounted for 1.8 million units.

We have seen the Indian PC market grow steadily over the years, especially in the consumer space. Strong growth in this space has put the Indian market parallel to global trends and adoptions. Also, the good news for PC manufacturers is that India is still a promising market. For a long time, computer manufacturing companies across the globe have been quite anxious about the Indian market and now they have been successful in their attempt to convert the Indian PC market into a profitable zone. Much of the success can be attributed to the astonishing performance of the branded PC manufacturers.

We want India to emerge as a manufacturing hub

The past has been momentous to the electronics industry in India. If we move three decades back and compare the scenario, we realise how the industry has behaved against the different market forces. Over these years, the industry has seen the emergence of many brands in the market and what used to be popular in the years gone by is seen no more. Focus of the market has changed drastically. The components for radio-broadcasting, telephone and telegraphic communication, which were the earlier focus of the electronics industry, experienced a great growth in the nineties when the Indian government started opening doors to liberalisation and globalisation.

Undoubtedly, the in-house manufacturing activities have improved in the past few years. HCL itself has contributed a lot to these activities. Even companies such as Nokia

have set up their manufacturing plants in India. These are the indications that the trend will pick up pace. The move will ultimately bring the prices of gadgets such as laptops and mobile phones down, making the market more competitive.

We want India to emerge as a manufacturing hub in the coming years. There is no reason that we can't. Though there are a few areas that need focus—from building infrastructure to availability of raw materials—we at HCL believe that the things are moving in the right direction.

George Paul, executive vice
president, HCL Infosystems
