

Indian Technological Products

Though we are in trading but unlike other firms in this sector, global recession did not affect our business to a great extent. It is possible due to our long-term, quality-focused business policy. We never compromise on quality. As a trading house we always represent us as a reliable interface between the vendors and the customers. Our customer base is quite strong, yet we are planning to expand it to the promising sectors like telecom and power. Sales force productivity is an important parameter in our growth strategy. We use a unique combination of sales automation tools and the manual approach for better customer relationship management.

Anil Batra
CEO

Relaytronics

This market slowdown has affected us but we are not dumping our growth strategy. We are going to expand our line of products keeping the futuristic need in mind. It's a good time to invest on design and development related activities. So we are also planning to diverge into solution-providing segment, reshuffling our existing talent pool. We are trying to strengthen our service sector by utilising CRM tools more and more. At the same time, we are exploring new verticals to expand our customer base—government organisations and PSUs in the fields of infrastructure, power and security as well as SAARC countries are of primary focus.

Cermet Resistronics

We are introducing a new value-added product range and following a value-specific marketing strategy, e.g., we are increasing the production of higher-value resistors to earn more revenue. According to us, this phase is an ideal time for brand building and internal development as we hardly get any time for these during rush time. We are also using ERP to improve our productivity. For the near future, we have a definite plan for inorganic growth. In fact, as an Indian company it's difficult to sell products in European market with our brand name. So we are planning to acquire a European company and sell our products in Europe under the brand name of the acquired company.

P. Hadlikar
Director

SLN Technologies

We are going ahead with our growth strategy in spite of the financial crisis, and we intend to stay on top of it. We are focusing on short-term R&D projects using our core competency in time-bound research work. Some new fields like RF design will be explored for this purpose. We are focusing on export for top-line growth. We are going to implement a more competitive business model. It will be based on 'value for money' and entirely 'customer focused'. Moreover, we are counterbalancing the seize on capital investment by service upgradation. We are also planning to strengthen our sales workforce by new recruitment as well as sales automation.

M. Anil Kumar
Director

Parker Power System

We are expanding in terms of augmenting our capacity. We are building a new factory at Greater Noida. This will be nearly double our existing capacity and we intend to cater to both domestic and export markets, especially with a product range compatible with solar panel. We expect to add 30-35 per cent more new customers mainly in South Africa, Afghanistan and SAARC countries. For this purpose, we have a definite plan on new recruitment. We plan to recruit around 100 new executives in marketing and export departments and more workers to add up to our existing workforce of around 1000 skilled labours for our new factory. We may strengthen our sales force with new recruitment as well as sales automation tools.

Sunil Bhatnagar
Director-Export

Epcos

We are going ahead with our expansion plans. I believe that the main issue is about faith in the Indian economy's growth story. Our parent company EPCOS AG has shown lot of faith in India's growth potential by investing in manufacturing facilities here. Currently, we have two factories and during the current year, we have acquired land in Haryana (Bawal) for building our third factory in India. The domestic demand for components is still at very low level, when compared to other Asian countries, and therefore over 60 per cent of our local production goes to export markets. As a result, our Indian activities are also affected by the global economic crisis. However, we believe that the local demand for components will grow in the medium to long term.

Farnell

At Farnell we have a strategy and a clear plan to execute it. It is what we have been focused on for two years and we will continue to drive it forward, at greater pace than before, but it will be our speed and agility that will change, not our basic plan and approach. Our belief and trust has been reciprocated by the fact that we have grown by 21 per cent in the third quarter as against Q2. We have in the last two months increased our product offerings. We have enhanced service to the embedded design community in Asia-Pacific by increasing locally stocked embedded products to over 2000 lines. We are not a company in crisis. Though there is danger out there in the markets, there is also an opportunity—we have the strategy, the team to drive it and the agility to move at fast pace.

Salman Syed
Director-APAC

Bose Research

As an R&D organisation in 100 per cent growth mode, we are not much affected by this market slowdown. We cater customers mainly in Europe and the USA. Still we are maintaining a strong customer base due to our quality-focused strategy. Our experience of working with large global corporations and new-generation technology companies helps us to build new products, implement cost-effective design techniques and evolve technology strategies necessary in today's dynamic design environment. We usually follow 1:1 non-disclosure policy with 100 per cent subsidy from the investor. But now we are expanding with a new diverge growth strategy where we will sell the same design to more than one customer at a much lower price. We are also going to introduce a new range of design solutions in power electronics and medical equipment sectors.

Debrupa Basu, Director
