

1012 ohms/sq., resistance from 103 to 1012 ohms, temperature from 32°F to 100°F, and humidity from 10% to 90% RH. It is designed to test conductive, antistatic and static dissipative surfaces for electrical resistivity/resistance according to EOS/ESD, CECC, ANSI, ASTM and UL test procedures.

The megohmmeter is an easy-to-use audit kit for conductive and dissipative surfaces. It can be used in all facets of material production including engineering, maintenance, quality control, incoming inspection, manufacturing and research, or sales departments for testing of antistatic mats, floor finishes, paints, wrist straps, smocks, foot wear, bags and containers.

Portable meters for watt, VAR and PF

Meco-G offers portable meters for measuring active power, reactive power and power factor in single-phase and three-phase balanced- and unbalanced-load AC systems. These meters conform to IS 1248 standards and

are particularly useful for laboratory research institutes, technical education institutes like polytechnics and engineering colleges.

TOOLS & EQUIPMENT

Integrated RFID system

The Ha-VIS RFID system from HARTING simplifies the realisation of RFID projects. It features readers that perform key functions on location. Thanks

to efficient data pre-processing, the readers take loads off network traffic on company-wide Ethernet networks and enable dynamic performance for high-speed applications like baggage conveying systems.

In order to integrate virtually all RFID transponders, the readers feature UHF and HF technologies as standard. These are supported by the Ha-VIS RFID suite—an efficient software solution that allows scaling of RFID solutions from individual readers to corporate solutions across different locations. The Ha-VIS RFID suite administers the interfaces to the RFID reading devices and printers, as well as to barcode readers, sensors and controllers.

PICmicro programmer/debugger

eCHIP has launched a low-cost PICmicro programmer/debugger. The ePK2lite supports 5V devices and is powered from the USB port. It supports full-speed USB programming, thus reducing the programming time. The device is also identified automatically. Programming and debugging can

be done through MPLAB, while only programming can be done through PICKit2 software.

The ePK2lite ships with a USB cable and a 40-pin ZIF socket for device insertion. The MPLAB and PICKit2 software can be freely downloaded from Microchip's website.

Discrete assembly support platform

GE Fanuc Intelligent Platforms has introduced a breakthrough solution for discrete assembly support tasks. The StationPortal provides a completely new architecture for assembly support systems, greatly increasing the speed of deployment and optimisation, while providing a significantly lower total

cost of ownership.

It is a great fit for production support tasks such as error proofing, line balancing and material call.

The StationPortal provides a common Ethernet interface for typically disparate inputs/outputs such as pushbuttons, bar-code

scanners, LEDs and torque guns. These inputs, and more importantly their information, tie directly into GE Fanuc's Proficy software package for discrete manufacturing, which comes with a 100-tag data historian. This architecture provides the power and flexibility of a central, server-based configuration.
