

BIG PICTURE IN SMALL PACKAGE

Palm-sized LED projectors can be highly useful for mobile professionals. These are versatile and yet can fit into a small area

Samsung P400 projector

The first time I saw an advertisement displayed through a tiny light-emitting diode (LED) projector, I found it cute, but was apprehensive about the projector's performance. Surprisingly, this miniature projector—diminutive in size and weight—does not fall short on brightness and has a lot of practical uses. It is tiny enough to squeeze into your laptop bag but sufficiently bright to display crisp images.

With LEDs becoming increasingly popular, companies are manufacturing more and more LED products and miniaturising them with the passage of time.

Industry observers opine that LED palm projectors can be highly useful for business purposes. "They come in handy while giving short

presentations for small groups. They are versatile and yet can fit into a small area," they feel. Most of these palm projectors that are available in the market use digital light processing (DLP) technology, in which light is reflected from a DLP chip to create the image.

Brightest LED projector

Targeting business and home consumers, LG Electronics India has launched a palm-size pocket projector—the HS102G. It offers up to 30,000 hours of LED lamp life, 160 ANSI lumens of brightness, 2000:1 contrast ratio and 1.1m short throwing distance. This DLP projector comes in a highly glossy black finish, with a red touch button. Other features include a USB port and a built-in 1.2W speaker.

Having a footprint of just 5.4×11.7 cm² and weighing 780 gm, this LG

projector functions at full power within seconds, and users can switch it on or off within five seconds. Its external battery ensures two hours of usage. "These features make it a perfect business companion that guarantees top-notch performance every time. This LED projector is versatile and accommodates any home entertainment environment with easy connectivity to nearly any consumer electronic device, including media players, DVD players, computers and video game consoles," says R. Manikandan, business group marketing head, business solutions, LG Electronics India.

"A remarkable combination of portability, versatility and reliability, the HS102G is the world's brightest LED projector. It is perfect for displaying information in schools or universities, or during business presentations, and is reasonably priced at Rs 59,990," adds Manikandan.

Apart from its unique features, the projector stands high on environmental standards, claims the company. The LED lamp does away with mercury and discarded bulbs. Moreover, its low power consumption (ECO 60W) reduces CO₂ production during use.

Smallest LED projector

If LG claims to have launched the brightest LED palm projector, Sony insists it has developed the world's smallest LED projector. Measuring a mere 410 cm², it is equivalent to the size of two business cards and shorter
