

LG HS102G projector

than a standard ball pen. The projector uses 1.6cm, 800×600 transmissive LCDs as display devices. The transmissive LCDs and a prism for synthesising light beams emitted from the three devices are coupled together to form a unitary component.

Another remarkable innovation that has been employed in the projector is the reduction of distance between the LEDs and the display devices—helping it to become the “smallest in size.” A total of 14 LEDs are used, comprising four red, four blue and six green diodes. The brightness of the LED reaches 50 lumens. The power consumptions required for the LED unit and the entire projector are 20 and 30 watts, respectively. A wide colour gamut of 120 per cent NTSC can be achieved.

Samsung, too, is not one to lag behind when it comes to innovation. The company released its ‘ultra-small’ LED projector P300—a pocket-sized, lightweight device. The P300 boasts 24 ANSI lumen brightness, a 1000:1 contrast ratio and a resolution of 800×600. Its battery life is a healthy 2.5 hours. The P300 weighs a sparse 660 gm and has dimensions of 12.7×9.3×5 cm³. It comes with a special connecting cable, D-sub (PC) and AV input, and is available in the UK for £499.

Samsung has also unveiled its latest—the P400—that is a lot smaller and lighter than most standard projec-

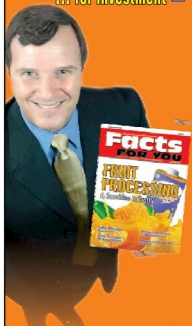

tors, including portables, according to the company. In particular, it uses an LED light source with a 20,000-hour lifetime—long enough to last the life duration of the projector. Setting up this projector is easy as it comes with a video graphics array (VGA) cable and a remote. To connect to a computer, one can simply plug in the power block and VGA cable, point the P400 at a screen or blank wall, and adjust the focus. There's no zoom, but one can adjust the image size by moving the projector closer to or farther from the screen.

According to an industry insider, the P400's USP is its brightness, and it measures at a substantial 115 lumens, about 77 per cent of its 150-lumen rating—a typical difference between the claimed and measured brightness for a projector. However, its video quality while playing a DVD has been reviewed as ‘disappointing.’ The projector loses much of the detail in dark areas and the rainbow effect is even more prominent than in computer images. Although Samsung P400's video shortcomings are significant, its audio and the ability to handle computer images are more than impressive for its size and weight. It may not be recommended for applications like watching movies, but is good enough for video games.

These versatile and petite devices prove that good things do come in small packages! ●
