

How is the Industry proceeding?

Voice of Industry	Modus operandi...	Strategies...	Best achievement...
 Senthil Kumar M.R., vice chairman, Pantech Solutions	We started by guiding students on technical projects, then proceeded to manufacturing kits and circuit boards, catering to the electronics labs of various engineering colleges. Now we have decided to launch technology-based courses in embedded systems, VLSI, DSP and IT	We follow the code of ethics. By ethics we mean conduction of business operations strictly in adherence to the law of the land, and in pursuance of the legitimate demands and the claims of the clients	We conducted a "faculty development programme on embedded systems—ARM & VLSI in association with Canada India Institutional Co-operation Project (CICP)"
 C.P. Ravikumar, director-university relation, Texas Instruments	Our university programme aims to strengthen the ties between Indian universities and TI India. It includes funding R&D in colleges, help establishing labs in colleges, help conduct workshops at colleges, help in teaching and curriculum development, and train-the-trainer initiatives. We also have an internship programme for students and faculty	It is important that we do not hype things up in our zeal to promote electronics amongst students and faculty. College students and faculty appreciate serious efforts from the industry towards project ideas, project reviews, teaching and curriculum development	We have a successful partnership with Cranes Software as part of our university programme. Cranes Software promotes TI products such as DSPs, microcontrollers, Beagle boards, analogue and medical electronic products. They run training programmes pertaining to TI products
 Naresh Narasimhan, country marketing manager, Tektronix	Engineering students need to understand complex circuit and electronic design to develop next-generation technologies. To help prepare students for tomorrow's design challenges, Tektronix is committed to support the unique needs of education through various programmes. We offer a comprehensive set of classroom and lab resources that cover basic concepts to advanced techniques of test and measurement	We support the unique needs of the education sector with industry-standard test and measurement equipment geared towards education labs, classroom/lab resources that provide the latest theory, application information as well as measurement techniques and exclusive education promotions and offers that make it easier to bring innovative products into education lab	
 Anil G. Chowta, director, FALCON	Falcon has been particularly catering to the education sector since 1990, specifically the technical training institutes worldwide with its telecom training systems and TMI products. This is the only sector FALCON has been doing business with	Organisations may only need to look at and concentrate on the ethics and quality of goods and services offered to this sector. The education sector has a mechanism adopted by them which is well-equipped to regulate pricing of purchases made by them	The first success for FALCON came in the form of telecom training systems range and, more recently, the launch of our test & measuring instruments that was again particularly focused towards this sector
 Ashutosh Agarwal, export manager, Omega Electronics	Our product range includes antenna, satellite, RFID, GPS, radar, computer interfacing, instrumentation, communication, LAN and VLSI trainers, microprocessors, microcontroller & interface trainers, electricity trainers, consumer electronics demonstration trainers, test and measuring instruments, microwave test benches, educational wall charts, robotic kits, decade boxes, etc	In this sector, the biggest expenditure should be on R&D. As new courses/syllabus/technologies are coming up, companies need to cope up with these new systems/solutions to grow in the market	We have recently supplied our product antenna trainer to Fox Valley Technical College in USA
 Pawan Gupta, consultant, SoftTech Engineers	We have developed and deployed e-learning solutions as teaching/learning aids in various subjects of engineering with multimedia-based tools as proprietary software packages. The learning objects are integrated with Web-based learning management system to create e-classrooms, e-resource centres and e-learning centres in institutions/organisations	We place a greater emphasis on production of better teaching and learning strategies and design courses that enable the delivery of a true learning product rather than serve as a mere repository for reading material somewhere in cyberspace	We have supplied e-learning software solutions to many prestigious engineering colleges in India and abroad. Our Campus Online Information System is an initiative towards the need of e-governance in educational institutions
