

IN-PLANE SWITCHING Makes TV Viewing Enjoyable

In-plane switching technology in LCD TV makes picture quality sharper, colour resolution higher and fast-moving images clearer

With technology improving rapidly, manufacturers of consumer electronic products are vying with each other to occupy the leadership position. To be one amongst the first and to consolidate its position in the Indian LCD TV market, LG Electronics India took the lead once again. It offers a new technology to its customers by launching the in-plane switching (IPS) in all its future LCD models. "This makes television viewing a much enjoyable experience with never-before sharpness, colour resolution and clarity in fast-moving images. It will also help immensely in watching action-intensive sports and for playing PlayStation 3 (PS3) games," says Amitabh Tiwari, business group & marketing head of home entertainment division and B2B, LG India.

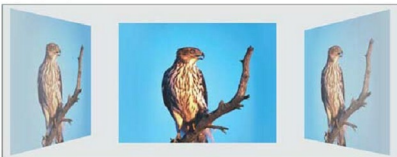

"With IPS technology in all our future LCDs, we aim to establish ourselves as the technology leader, attaining a market share of 33 per cent in the LCD segment in 2009," adds Tiwari.

IPS technology will enhance consistent colour in motion pictures from all viewing angles. Also, this panel is appropriate for touch panel application. "We believe that this technology will be applauded by our customers," Tiwari adds.

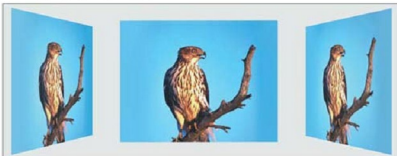

IPS technology has found admiration from renowned institutions and technical experts alike. Dr Manish Sharma, an eminent professor at IIT

IPS technology will enhance consistent colour in motion pictures from all viewing angles

Delhi, says, "IPS LCDs have won unanimous favour of professionals because of dynamic definition and is the most precise technology for colour reducibility as the pure-black layer is much clearer giving a perfect colour resolution. IPS has features realising wide viewing angle and rapid response, which enables clear display of vivid, realistic images in action-intensive sports and high-speed gaming. Hence, this makes IPS a suitable technology for home usage as well as for the professional sector."

Keeping in view the advantages that

this new technology has to offer, LG India plans to introduce IPS technology to its entire prospective LCD lineup above 56 cm and plans to launch 35 models of LCDs by this year end. The price of LG TVs will go up by 2 per cent, "not because of the IPS technology, but because of the added features that will come with the new technology," justifies Tiwari.

Customers' delight

Speaking to *Electronics For You*, Tiwari explains how the consumers will benefit from this technology. "Power consumed
