cards such as MultiMediaCard (MMC), SecureDigital, CompactFlash and MemoryStick (for Sony) for storage. In case you have a handheld gadget like cellphone or digicam using memory card, make sure that you choose an MP3 player that accepts that particular card too.

Battery type, replaceability and life. Most players come with an inbuilt rechargeable battery. When you connect it to your computer or laptop, the battery gets charged automatically. After full charging, it can play audio for up to 15-30 hours and video for up to 2-6 hours depending upon the brand and model of player you are using. Battery life of no less than 12 hours for music and four hours for video is a good bet. Rechargeable batteries last up to three years depending on the usage.

A few players have battery bays for AA or AAA batteries. Generally, users don't prefer the recurring cost of replaceable batteries.

Display. The display lets you easily select your music by artist, album or genre. It is also useful when you're looking for a particular radio station.

In audio formats, the displays available are 2.5cm black & white (capable of one to three lines), 2.5cm colour and 3.8cm OLED.

In video formats, the screen size varies from 3.8 cm (1.5 inches) to 8.9 cm (3.5 inches) with 262,000 colours. The screen type varies from TFT to QVGA/WQVGA. The resolution also varies from 128x128 to 240x400.

Hard disk players may come with a colour screen for song info and for viewing your digital photos.

Music store. Online music buying is not very prevalent in India but is a normal practice in West. The benefits of online music buying are:

1. Offers instant, legal access to hundreds and thousands of songs
2. Allows you to preview/prelisten and purchase individual songs instead of the whole album
3. Legal source complies with copyright laws

4. More consistent and higher-quality metadata

Software bundled with the player. Good bundled software is a great bonus as the quality of your recordings depends on the quality of software you use.

Media player is the software used for playback of multimedia files. Typical features of such a software are:

1. Rips music from a CD and saves it as an MP3 file
2. Burns MP3 file to CD or DVD
3. Organises MP3 files with ID3 data tags
4. Allows you to create your own playlists

It's important that the media player software is supported by the operating system of your computer.

Some common software are iTunes, Real Player, Windows Media Player, Quick Time and KM player.

Other extra features (like FM tuner, voice recording, games, etc). Most MP3 players come with FM tuner. FM comes very handy for current news update and change in music entertainment. Lots of college students are using voice recording feature very innovatively. They record lectures in the classroom and prepare notes at leisure. This helps them focus on the content at the time of lectures. A 1GB MP3 player can support voice recording of up to 65 hours, while a 2GB player can support up to 135 hours.

FM tuner and voice recording are standard features on all Philips digital players. Also, high-end players from Philips come with inbuilt noise cancellation feature.

Accessories. Flash-based MP3 players need speakers and amplifiers for loud sound. Lots of docking systems are available for these music players. The small and sleek players can be worn on the body as ornaments. The related accessories are available in various shapes and sizes. Philips provides high-definition earphones with noise-isolation technique. ●
