

Solid-state drive

Combining the speed and durability of solid-state technology, Transcend's SSD18M storage device offers fashionable good looks and high-capacity mobile storage convenience. Unlike traditional hard disk drives, it contains no moving parts, which not only eliminates the possibility of mechanical failure resulting from vibration and shock but also provides substantial weight savings and reduced power consumption.

Its high-speed eSATA interface provides a maximum read speed of 90 MB/s and write speeds of 50 MB/s, while USB2.0 interface assures maximum compatibility with all types of notebook and desktop PCs.

Measuring only 80×50×12.5 mm³ and weighing just 50 gm, the SSD18M fits perfectly in your pocket, briefcase or purse. It is available in 32GB, 64GB and 128GB capacities.

TEST & MEASUREMENT

40GbE and 100GbE test solution

Tektronix Inc. has introduced new optical sampling oscilloscope modules for its DSA8200 digital serial analyser series that promise to lower the cost of

high-performance optical transmitter development and standards compliance.

The 80C10B and 80C10B with Option F1 (80C10B F1) provide a complete testing solution for compliance verification of next-generation transmitter standards from 40 Gbps to 100 Gbps and beyond. The company has also

announced the 80C25GBE module for 100Gbps Ethernet (100GbE) manufacturing and compliance verification.

Electronic ballast analyser

Mangal offers a ballast analyser to test CFLs, tubelights, HIDs and electronic ballasts. It can show the specifications and waveforms on a big colour LCD

directly, so a computer is not required. Functions include start rush current analysis, current-waveform phase analysis, difference analysis of lamp current in every successive half-cycle, and pre-start time and pre-heat energy analysis.

COMPONENTS

Digital signal controllers

Microchip Technology Inc. has announced the first seven next-generation 16-bit dsPIC digital signal controllers (DSCs) for common, multi-loop switch-mode power supplies (SMPS) and other power-conversion applications.

These devices, offered in small DSC packages for digital power conversion (with footprints as small as

6×6 mm²), provide up to twice the performance at a significantly lower price than Microchip's first SMPS family. They feature an intelligent power peripheral that includes interconnected analogue comparators, pulse-width modulators and ADCs that are specialised for digital-power applications and can be software configured to adapt to a variety of topologies. This topology flexibility gives power-supply designers the complete freedom to optimise for specific product applications.

With the dsPIC33's in-circuit programming capabilities, common SMPS platforms can be differentiated late in the production process, saving both time and cost.
