

Translate your website with Google gadget

Internet giant Google has announced a new website translator gadget, powered by Google Translate that enables you to make your site's content avail-

able in 51 languages.

When people visit your webpage, if their language (as determined by their browser settings) is different from the language of the page, they'll be prompted to translate the page into their own language. If the visitor's language is the same as the language of the page, no translation banner will appear.

The translator gadget is easy to install—all you have to do is cut and paste a short snippet into your webpage to increase the global reach of your blog or website.

Wireless charging technology

Dell has come up with the Latitude Z business laptop that includes a new wireless charging technology. Latitude Z can be placed on a special stand that generates an electromagnetic field to recharge laptop batteries, wirelessly. The technology takes the same amount of time to recharge laptop batteries as it takes to change an AC adapter.

New OMAP-DM5x coprocessors

Texas Instruments has introduced two new OMAP-DM5x coprocessors which

have up to 20 megapixels imaging capabilities and 720p high-definition camcorder functionality.

The OMAP-DM515 and OMAP-DM525 coprocessors accelerate imaging and video performance, giving handset manufacturers an easy way to

upgrade existing handset designs with cutting-edge multimedia capabilities.

Single-chip T-DMB mobile TV receiver

GCT Semiconductor has introduced a mobile TV receiver—GDM7024—which has high performance single-chip receiver with built-in DC/DC converter.

GDM7024 claims to be the smallest in the market measuring 3.8×3.8 mm with limited number of passive components. It is the first T-DMB receiver IC in the industry to integrate the DC/DC converter, significantly reducing form

factor and byte order mark (BOM). This solution enables mobile TV handset makers to save considerably on cost and produce more competitive T-DMB products with higher performance mobile TV reception.

Wireless energy management system

Radio-Tech has developed an energy management system to enable organisations to monitor and ultimately reduce their energy consumption.

The company's wireless data capture technology allows monitoring of remote assets and consumption of water, electricity and gas, round the clock.

Radio-Tech provides a range of radio telemetry products ideal for sub-metering applications and helping organisations to measure energy consumption within particular areas. Low-power radio transmitters and data concentrators allow simple collection of metering data.

Weather forecast via IVRS

Handygo, a wireless solution provider in mobile and value-added services, shares weather forecast with the farmers. The company is providing meteorological information in rural areas through interactive voice response system (IVRS) and GPRS. This will empower farmers to get weather forecasts and advice by experts on various kinds of crops, on their mobile phones.

After signing a memorandum with the Indian Meteorological Department, Handygo has researched and gathered

information about the various regions, its locale and agriculture. Agricultural scientists at Handygo then processed the technical data into information which is accessible and understandable by the farmers.

The information is updated twice a
