

## Engineering Drawing

This book covers the complete syllabi of engineering drawing taught to the undergraduate students of engineering in the first year.

The book details procedures for solving problems of projections of lines, planes, solids, sections of solids, intersection of surfaces and development of surfaces. A method is explained to imagine the shapes of machine parts from pictorial as well as orthographic projections by dividing the same into projections of a number of simple geometrical solid shapes or by ascertaining the shape, size and relative positions of various bounding surfaces of the part. Procedure is given to correlate the orthographic projections of various solid shapes and bounding surfaces, whose combination is the shape of the machine part. Also explained is preparation of drawings using AutoCAD.

## Reliability and Life Estimation of Power Equipment

Useful for electrical engineering students at the graduate level, practising engineers and scientists in research laboratories, this book serves as a complete guide on dielectrics and electrical insulation. Principles of destructive and diagnostic testing of insulation, data acquisition and their analysis guide the readers in conducting scientific experiments.

Some case studies have been included to train practising utility engineers in analysing insulation degradation under service conditions. Also, a series of problems in the areas of electrostatics, physics of dielectrics, probability theory and applied mathematical statistics are given at the end of the book.

## Training in Experimental Physics Through Demonstrations and Problems

This book is the outcome of a research project carried out by the authors at the Homi Bhabha Centre for Science Education. The project aimed at developing innovative content and appropriate pedagogic strategies for the physics laboratory training at higher secondary and undergraduate levels.

Part I gives an overview of training in experimental physics, a classification of experimental activities, and the importance and role of laboratory training. It explains procedural understanding in physics and presents a model of science based on the problem-solving approach. Also offered are suggestions for selection and development of contents, instructional and evaluation strategies.

Part II covers experimental problems and demonstrations based on the concepts and their applications from mechanics, electricity, magnetism, electronics and optics. The teacher handout details the demonstration, while the student handout details the experimental problems. Finally, the authors list a number of possible modifications in the experimental problems and setups.
