

ADT MotionViewer wireless video intrusion detection system

functions will consume a good amount of power and can't be used on the battery alone.

So a security system should principally be electrically powered with long battery backup. Most of the security systems currently available in the market come with a built-in rechargeable battery to function as a secondary backup which can last for a minimum of five hours. In the event of a power failure resulting in a cut-off of the primary source of power supply, the secondary backup takes over.

Video surveillance, how important?

Video surveillance is added protection on top of the security system in monitoring the home. For the most fundamental reason, the presence of a CCTV deters intruders. It helps recreate the events for review and determine what really happened when you were not

watching. It ensures that you have the facts after an incident has occurred.

Video surveillance adds more precision to the security. With an audio door phone, you cannot be sure whether there is a single person standing outside the door or more people with the person who is talking through the outdoor unit. So video along with audio is much better.

DVR-based video surveillance combined with live real-time view on mobile and sensor technology can enable applications that make security proactive and not just a form of post-event evaluation.

Spash has launched OmniSurv—a Windows-based series of DVR cards for building multichannel video surveillance DVR systems. This solution provides video surveillance anytime, anywhere, enabling you to keep an eye on your home at all times. You can view continuous, live, real-time video on your GPRS-enabled mobile handset as well as remote PC/laptop through TCP/IP protocol at high speed and clarity.

Remote monitoring

It is through the IP technologies that homeowners can centrally monitor their homes at their convenience. You can control your home lighting and appliances, and monitor events through a Web-enabled device. Security alerts can be delivered through the Web-enabled device such as the cell phone.

Remote access to your home adds to convenience in terms of cheaper (24x7) communication and surveillance. It saves time and money by accessing home remotely for activating your desired system profiles. You may literally carry and communicate to your home wherever you move.

Remember, you should opt for remote monitoring only if the situation demands. Otherwise, it may hike the system cost unnecessarily. Also, if it is not well-designed and well thought-

out, you may be prone to hacking. Your camera clips may be available to hackers. Hence while selecting a system with remote monitoring, ensure the data security solution.

Evaluate threat before freezing the components

Before deciding on the components of your home security system, evaluate key sources of threat, and then derive your security need. Decide your budget, then refine security needs to meet the budget.

Look for easy installation, maintenance as well as actual performance in crisis. Also, the system should be user-friendly. Sensors are extremely important to home security. If they fail, security is at risk. If they give wrong signals, it is a false alarm and so on. Sensors should be of good quality and able to track the slightest of movements.

Video doorphones are more of convenience than a security solution. These are restricted to the use of identifying a person ringing your doorbell and communicating with the same.

For the sake of convenience, all warning alarms, sensors and door phones should be connected to a central home security access monitoring device which logs details of all intrusions. This device should send reports and updates of the intrusions to you via SMS so that you are aware about the same from anywhere through your mobile.

How to get more value for money?

Ensure that the system integrates with your electronics appliances, so that these can be controlled from remote location through codes with user-defined passwords.

Digital systems are recommended. The reason: you'll have visitor clips accessible all the time, so your family is secured all the time. You have access to home on phone, SMS and Internet. You can add multiple devices whenever you need in and around the house. ●
