

Ex-gratia amount for the DHI model is calculated as:

One-day Salary (S) = (Basic+DA)/30

Part 1: For service-completed period

- For completed years = $S \times 45 \times \text{completed years (whole number)}$
- For completed months = $(S \times 45 \times \text{completed months}) / 12$
- For completed days = $(S \times 45 \times \text{completed days}) / 12 / 30$

Part 2: For service-remaining period

- For completed years = $S \times 25 \times \text{completed years (whole number)}$
- For completed months = $(S \times 25 \times \text{completed months}) / 12$
- For completed days = $(S \times 25 \times \text{completed days}) / 12 / 30$

A similar calculation can be done for Gujarat model (VRS) by replacing the factor '45' with '35.'

Software

The program is developed and tested in VB6 under Windows XP environment. The Gujarat model (VRS) is considered as central and the DHI model as state. Not necessarily all the states might be using the DHI model. In the code, subroutines are used to suit the calculations in both the models.

In either case, you can calculate service completed or remaining period using the code used in the subroutine:

```
caldiff(mystr1 As String, mystr2 As String)
tdate1 = CDate(mystr1)
tdate2 = CDate(mystr2)
dys = Day(tdate1) - Day(tdate2)
mnths = Month(tdate1) - Month(tdate2)
yrs = Year(tdate1) - Year(tdate2)
```

Few necessary adjustments are made using the code:

```
If dys < 0 Then
dys = dys + 30
mnths = mnths - 1
End If
If mnths < 0 Then
mnths = mnths + 12
yrs = yrs - 1
End If
Select Case mnths
```

Screenshot 2: VRS calculation for state government employee

```
Case 2:
If dys >= 28 Then
dys = 0
mnths = mnths + 1
End If
Case 12:
If dys = 31 Then
mnths = 0
yrs = yrs + 1
dys = 0
End If
Case Else:
If dys >= 30 Then
dys = 0
mnths = mnths + 1
End If
End Select
EMPCSR.Text = CStr(yrs) + " Years:" +
CStr(mnths) + " Months:" +
CStr(dys + 1) + " days"
```

```
EMPRSR.Text = CStr(Int(ryears)) +
" Years:" + CStr(pvmnths) +
" Months:" + CStr(nvdys) + " days"
```

Then you can calculate ex-gratia amount for completed and remaining service for DHI/Gujarat model using the code given in the function:

```
function calamt(mydays As Integer,
myyears As Double) As Double
myamt = myyears * mydays *
(Val(PBasic.Text) / 30) ' for
Pbasic only
myamt = myamt + (myyears * mydays *
(Val(PBasic.Text) / 30) * (Val(PrDA.
Text) / 100)) ' for Pbasic + DA
calamt = myamt
```

The final ex-gratia amount is calculated using the code in the click event CALVRS_click() of the command button:

```
Exgrntamt = Round(cyrsamt + ryrsamt,
2)
```

The minimum and maximum limits are checked using the Check_limits() function as given below:
