

BINAY - Lighting Up The Future

BINAY LED-based HIGH, MEDIUM and LOW Intensity Aviation Obstruction Light Beacons

As per International Civil Aviation Organisation (ICAO) requirements Available in Low Intensity, Medium Intensity and High Intensity versions (as per International Civil Aviation Organization guidelines), BINAY's patented LED Aviation Lights come with 5-year/3-year warranties

LED Obstruction Lighting for:

- Industrial chimneys and smokestacks
- Transmission, microwave and cellular towers
- Radio, TV and similar structural towers
- High-rise buildings and structures
- Airports and airfields

The Binay LED Aviation Obstruction Light offers the following advantages:

- Fit-and-forget maintenance-free operation
- A long life of 100,000 hours (20 years at 12 hours daily burning)
- Pays for itself within a short period of operation in the form of reduced installation, maintenance and servicing costs
- Quick Installation; Reliable operation 365 days per year
- Shock-proof and vibration-resistant
- Over-Designed Intensity to allow for natural LED intensity degradation over its operating lifetime

THE BINAY LED OBSTRUCTION LIGHT IS UNDER ACCEPTED PATENT, AND AS SUCH IS A PROPRIETARY PRODUCT

E-dogs can be used to detect explosives at places such as bus stations, airports and railway stations. The e-dog will be powered by a rechargeable Li-Po battery and will be very easy to use and maintain. It will be commercially available in two years.

Real bomb-sniffing dog versus e-dog

Turn your favourite sunglasses into night-vision goggles

If Prof. Gabby Sarusi of Ben-Gurion University of the Negev has his way, very soon you will be wearing your favourite shades in the dark! Yes, you heard that right. Sarusi and his team are currently working on a material that could practically turn any pair of glasses into night-vision goggles. Thanks to the team, we might soon be able to say goodbye to the ever bulky set of traditional night-vision devices and replace them with our favourite and even stylish pair of designer eye gear!

The team is currently working on creating a thin coating that will turn invisible infrared light into visible light for effective night vision.

Contrary to other expensive and bulky night-vision systems, Sarusi's team is looking to develop a one-micron-thick layer that could be applied to any pair of glasses. The ambitious project will take five years for completion. However, once successful, it will prove to be a very noteworthy tool for one and all.

Everyday motion to power cell phones

Researchers at the Georgia Institute of Technology have developed a novel concept of harnessing everyday motion such as vibrations, rubbing and stepping to fuel mobiles and other similar devices. This technology could be used to tap into the endless energy of ocean waves to meet the world's ever-growing energy demand in the near future.

Zhong Lin Wang and his team of researchers have built the world's first triboelectric nanogenerator (TENG). The nanogenerator successfully deploys the phenomena of

New cell-phone-charging system harvests energy from vibrations
