

Snazzy Wearables at CES 2014

Subsequent to looking at some interesting home automation tools showcased at CES 2014 in the previous issue, let us now take a quick look at some exciting 'connected' wearable technologies.

Epson's Moverio BT-200. These smart glasses fuse video and images over your actual view of the surroundings. With advanced projection and optics technology, these transparent smart glasses enable a full 360-degree, interactive experience of 3D games, video entertainment and augmented reality applications.

With a powerful processor and a

Epson Moverio BT-200

whole range of apps available on the Moverio Apps Market, this Android device is GPS-capable and equipped with Wi-Fi, Bluetooth 3.0 and Miracast connectivity.

Netatmo's June. Too little of the sun will result in weak bones while too much of it causes sunburns! Well, just how much can you manage? Netatmo's June is a trendy bracelet that helps women manage their sun exposure. It measures sun exposure using ultraviolet (UV) sensors and works with a companion iPhone app to give

personalised sun protection advice to avoid sun damage and prevent premature skin aging.

Jaybird Reign. There is nothing new about fitness bands, many of which are doing the rounds today. But, the Jaybird Reign caught the fancy of viewers at CES as it has a unique feature of suggesting a 'Go-Zone' for

Jaybird Reign

you, which is the best time for you to exercise.

Of course, it also monitors your physical activities such as walking, running and cycling and also detects transitions between activities. Additionally, it also monitors sleep patterns and warns when you need rest.

FILIP. After jewellery, clothes and footwear, now wearable technology for kids! FILIP is a wearable locator and phone with GPS, Wi-Fi, cell tower location and cellular voice capability,

FILIP—wearable locator and phone

which provides reliable communication. But, it is not a real phone! As in, FILIP tries to solve the contradictory problem of wanting to stay in touch with your kids 24x7 yet not entrust them with a full-fledged phone at too young an age.

So, this watch and phone that works with a mobile app achieves the goal of: "One touch to call your child. One touch for them to call you. One touch to locate." The best part is that it is attractively designed to please kids!

Slide'em gloves. Though not a technology product per se, this product got noted at the CES by virtue of being a tech usage enabler. The

special winter gloves from Slide'em enable people to use touch screen devices even in the worst winters despite wearing thick gloves for warmth.

A specially formulated conductive material is designed into each fingertip for typing and texting with high accuracy. There is also a slider pad on the index finger and thumb for swiping left to right or sliding to unlock the device. The design of the glove displays a deep understanding of people's usage of touch screen devices. ●

Hands-free shopping

Now, here is an application that shows the true potential of the IoT. PayPal Beacon is a little Bluetooth low-energy device that restaurants and stores can plug into a laptop or power socket in their outlet. When customers enter an outlet, the Beacon connects with the PayPal app on their smartphone, and immediately recognises their details.

This can be used by stores for hands-free checkout, by restaurants to quickly serve the person's favourite drink, deliver messages about current offers and more.

Knight in shining armour

Here is a dream machine for security agencies, industries and the like. The Knightscope K5 Autonomous Data Machine is a robotic device that is capable of collecting information about its surroundings including offline objects. It uses a variety of sensors and predictive analysis to collect and analyse on-site information to alert the community or officers of unusual situations.

When an alert is raised, the machine powers up all its sensors to enable the community to review the situation and contribute important real-time information.

According to the company, this is a way to effectively crowd source security, and provide an important feedback loop to the prediction engine.
