Like *deja-vu* from sci-fi flicks, technology is getting larger than life. With camera drones, super camera smartphones, self-driven luxury cars, smarter wearables and smaller 3D printers, here is the must-not-miss from CES 2015.

The Consumer Electronics Show, CES, is one of the world's largest consumer electronics shows for a reason. Unquestionably, the presence of the world's largest consumer electronics brands showcasing and launching their spanking new products makes it the most awaited event. Like every year, CES 2015, held at Las Vegas Convention Center, Las Vegas, saw a complete preview of the tech trends and innovations.

Here is a quick tour of the biggest and most noticeable launches and announcements done this year.

Drones to capture and track movement

The drone zone at CES 2015 was all about cameras. Almost all significant drones seen here had cameras mounted on them. Here are the few notables:

EHang Ghost. A crowd-funded drone with a success story, EHang is all about taking aerial photos and videos. The drone can be controlled by a smartphone or tablet. The pilot has to draw a flight-path to follow, either by tilting the mobile device or having it auto-follow you.

AirDog. Like the Ghost, AirDog also follows your movements. However, instead of a smartphone or tablet, it uses an armband loaded with sensors, which communicate the data back to the drone with a long-range Bluetooth.

Maxaero X-Star. The X-Star is loaded with a slot-loading battery with around 25 minutes of flight, GPS guidance, safety features and a full-HD camera on a three-axis gimbal.

Zano. Belonging to a very successful Kickstarter campaign, this palm-sized quadcopter is controlled by a smartphone and can avoid obstacles, hold its position and know exactly where it is in combination with your smart device.

Trace. Not just a camera-carrying quadcopter, TraceR1 is a visually-intelligent camera, which is capable of autonomously controlling different devices, including the quadcopter, an RC-style car, a tripod gimbal and a dash cam. The camera can track a subject and live-stream directly to the Web.

The super camera smartphones

Cameras were not just the highlight of the drone section but were also a big and noticeable draw in the smartphones category. 8MP to 20MP cameras clearly indicated that next-gen phones are all about smarter and bigger cameras. Among the huge list of these smartphones that made their first appearance at CES 2015, few notables are:

Kodak IM5. What could define the camera trend better than the camera giant, Kodak, itself venturing into the smartphone sector by launching its very first handset, Kodak IM5. This 12.7cm (5-inch) device has a user-friendly interface, 13MP rear camera and operates on Android 4.4.

LG G Flex 2. One of the highest-profile smartphones at the show. With its curved, flexible body and top-notch specs, the device was definitely a show-stealer. Like its elder brother, G Flex 1, the body of this device can be straightened and bent again without breaking.

HTC Desire 826. This device features a cool front-facing ultrapixel camera of 4MP, 14cm (5.5-inch) display and an octa-core processor. For those who are unaware, an ultrapixel camera is an advanced imaging technology that allows you to quickly shoot vivid, true-to-life images with a wide range of colours, even in low-light conditions.

Lenovo Vibe X2 Pro. Backed with breathtaking specs, like 1080p display, 64-bit Snapdragon octa-core processor and 13MP

LG G Flex 2
