

camera at both ends, this smartphone by Lenovo managed to get a lot of attention. The phone comes with a flash accessory that can be plugged right into the phone's 3.5mm headphone jack for taking perfect selfies.

Huawei Honor 6 Plus. Popularly compared with Apple iPhone 6 Plus, at about half the price, this handset sports 14cm (5.5-inch) display, a sleek metal design and 3600mAh battery. For selfie lovers, the phone sports 8MP shooter at both ends.

Asus Zenfone ZOOM. This version of Asus' Zenphone is custom-created for camera lovers. With features like 13MP rear camera with 4128x3096 pixels, laser autofocus, 3x optical zoom, optical image stabilisation and dual-LED flash, you are sure to click brilliant pictures. Similar to Zenfone 2, this device comes in 2GB and 4GB RAM variants.

Tonino Lamborghini 88 Tauri. If ultra-luxury is your style, then this US\$ 6000 smartphone from Lamborghini might excite you. This smartphone by the automobile manufacturer dons calfskin leather with stainless steel. For shutterbugs, it also sports 20MP rear camera and 8MP front camera.

Automotives that bring sci-fi closer to reality

This year, in automotive we saw bigger trends, like auto parking, self-driven cars, gesture control and luxury. CES 2015 reassured that gadgets from movies, like James Bond's Tomorrow Never Dies, are not far from reality. (Yes, we are pointing to the BMW car chase from this bond flick.) Automotive in CES was nothing short of awesome. Below are three major highlights:

BMW i Connected Mobility. Yes, it is real! Similar to the scene from the James Bond movie, Tomorrow Never Dies, your BMW will now be able to pick you up by itself. The smartwatch-controlled BMW i3 can also avoid obstacles and park autonomously. The i Connected Mobility suite of products allow BMW i3 electric vehicle to incorporate public transportation into their travel itinerary. With BMW's i Remote app for Android, users can access the

best route, be it by car, bus or train, on a smartwatch or smartphone.

Audi Virtual Cockpit and MMI. With Audi 2016 Q7, Audi is bringing in virtual cockpit and multimedia interface, or MMI. The car features life-like 3D graphics, powered by Nvidia, on two high-resolution screens. While one is positioned behind the steering wheel that is customisable, the other touch-pad, with eight programmable buttons, is on the centre console to make inputting addresses and accessing menus easier. Google Voice recognises natural speech commands for placing calls or choosing song titles. The clincher is an optional rear entertainment system that features two HD tablets, both of which can be

used outside the vehicle, just like an iPad.

Mercedes-Benz F 015. Hold your breath! This year at CES, Mercedes presented a re-interpretation of the self-driving car concept with their F 015 research vehicle tagline Luxury in Motion, which is absolutely justified by the technology the car holds.

The interior of the car is more like a lounge than a cockpit. Seats can be rotated to face inwards, the car can be driven both manually and autonomously, where in case of earlier, the steering wheel extends from the dashboard. The body is made of carbon-fibre composite, aluminium and high-strength steel in a unique way so that it does not need a support pillar between front and rear doors, which allows the doors to give wide-open access to the interior.

Similar to BMW i3, it supports features such as self-parking or calling the car to pick up the owner.

Wearables for cars, health and captures

While wearables were the big thing in the automobile sector, it was not all about automobiles. There were much bigger hopes from wearables in CES 2015, as we saw big names like Google, Samsung, Sony and Apple jumping into the wearable sector in 2014. And, standing true to anticipations, this year's CES saw a huge range of smarter wearables. Below is a summary of what Las Vegas witnessed:

LG. Sticking close to the automotive section, we would first mention LG's smartwatch, which was teased at Audi's show. This smartwatch, especially designed for Audi owners, does not run on Android but runs Open Web OS in the background. It sports a classy design, which looks somewhat similar to Moto 360. Detailed features and pricing are yet to be announced by the company.

Misfit and Swarovski. How many times have you heard women complain
