

This robotic turtle can be used for underwater surveillance, water-quality monitoring and energy harvesting in future

said that there is no ballast system being used in the turtle robot. A ballast system is very common among underwater robots that are used for diving and sinking purposes.

As there is no ballast system, this robot is much smaller, and hence light-weight. That is why it can carry bigger payloads. This quality makes it capable of performing many complicated tasks, like underwater surveillance, monitoring water quality and so on. The turtle robot can charge itself, which means it does not need to visit its base station repeatedly for recharging. It is very fast and does not lose speed while turning corners.

Co-researcher, Abhra Roy Chowdhury, has revealed that four more underwater prototypes have already been developed, which will finally give birth to a spherical robot that acts like a puffer fish. Jet propulsion technique is used by this robot, just like jelly fish.

NASA's new app for ISS fans

Are you interested in NASA's International Space Station (ISS)? Then, NASA has some good news for you, as you can now keep a daily track on the space station via their newly-launched app. The new app from NASA gives information about ISS experiments, facilities and research findings.

The information will be provided through videos, photos, interactive media and detailed descriptions. The app has been dubbed as Space Station Research Explorer, and its experiments section contains six categories along with some subcategories. The category system has details about experiments through dots and there are some stems that connect the dots to the system. These stems portray the time that an experiment takes to be completed on the orbit.

Users can go through all experiments through these categories and subcategories. If they are searching for a specific experiment, they can do so using the search option. Details of the experiments also list important links, photographs and papers.

The app's Facilities section gives an insider view of

Now BINAY Circadian PowerLED Lights Can Make You Healthy

BINAY kelvin-changing Human-Centric Circadian PowerLED Lights are designed to affect the human circadian rhythm positively for enhanced physical and mental well being

BINAY has developed kelvin-changing Human-Centric Circadian PowerLED light fittings which have colour temperature changing properties. The colour temperature of the light emitted by these fittings can be manually changed as desired, or set to change according to a pre-set programme. These lights affect the body clock in the human body positively, encouraging the release of appropriate hormones depending on the time of the day (thus leading to increased alertness and productivity during daytime, and improved mental and physical relaxation in the evening).

Greatest importance for applications in:

- **Workplaces such as office and factories**
(for enhanced productivity and improved alertness)
- **Healthcare facilities such as hospitals and nursing homes**
(to facilitate patient recovery)
- **Educational applications such as school and colleges**
(where enhanced mental concentration is required)
- **Residential applications**
(alert and productive cool daylight during the day, and restful warm white in the evening)
