

QUICKLY

Simplify your connected (IoT) product development and deployment, and go to the market quickly, with quickSense and quickConnect. quickSENSE is an easy to deploy and use, highly scalable, fully customisable active sensor product that not only has four basic elements viz. sensor, embedded computing, security and connectivity, but also has actuators for most of the models. The dual connectivity option of some of the quickSENSE nodes makes them suitable for being used as edge nodes as well as sensor hubs. All of its edge nodes are multifunction sensors and present high level of abstraction at various levels of cloud compute and user applications. With high scalability factor and seamless integration capability, these nodes are easy to deploy and use. These nodes also provide real time data.

quickCONNECT is a middleware platform with more than just the connecting functionality. It has the capability to store time-series data and process complex pre-defined rules. It provides ReST based APIs which can be used by client applications to interact with the platform and in turn with the sensors. Each quickSENSE node ships prequalified and can directly communicate with quickCONNECT platform, out of the.

SUPERFAN

There are an estimated 350 million fans operating in India and they demand 14,000MW of electricity. Superfan can bring this energy usage down to 8000MW. Each Superfan you choose over other ceiling fans can save at least 64 units of electricity in your home, 42Kg of coal, 51Kg of carbon emission in every year of operation! It is remote controlled, has low harmonics, provides consistent air delivery even at low voltages, and is available in vibrant colours. Save energy, save money, live happily!

TEEWEE

Teewe is an HDMI Dongle which plugs into your television and lets you stream content from multiple sources like YouTube, local content on your phone or laptop onto your big screen television in HD quality. Teewe uses your smartphone as a remote control and a content display medium to bring you relevant content in a nice usable interface.

TOMAR

What if you had the power to control things just by moving your hands in the air? Tomar 1 is a wrist band that gives the same kind of power to the user by bringing gesture recognition in IoT. As a person, we are surrounded by electronic devices since we wake up to the time we go to bed. By wearing this band you can point to any electronic device you want to control and can move your hand in the natural way to control it. Example: rotate your hand clock-wise and anti-clock wise to control the volume of the TV. This band works with the smart devices and the automation solutions (Home, Office, Industrial, Hotel, Automobile etc.) The developers of Tomar are looking forward to work with the automation partners and system integrators across the globe to take this revolutionary technology to the consumers.

TOUCHLINK

This new near field communication (NFC) technology uses electromagnetic fields to transfer data at incredible rates (above 20Gb/s) with power consumption less than that of Wi-Fi, Bluetooth or wired data transfer. Data can be transferred through any conducting material, including human body.
