Fig. 14.4: Just click on Create A New App Password under App password. When you do that, you will be provided with an app password that you can type (or copy and paste) into the application.

Microsoft provides a mobile app called Authenticator that can generate these codes even where there is no network coverage (offline mode).

In the Authenticator app on a Windows phone, click on Add (+)

For example, for Microsoft Outlook 2013 (Fig. 14.3), if you had previously configured Outlook for Hotmail or Outlook.com and then configured the underlying Microsoft account, the next time you use the application, you will be prompted to enter your credentials again. And you will need an app password because your normal password will not work.

You can get an app pass code in the security info section (<https://account.live.com/proofs/Manage>) on Microsoft account management website (<https://account.live.com/>) as shown in
