

Solutions NAVAN can offer to a small or medium enterprise

Solution	Functions
Voice over Internet protocol (VoIP) telephony	Apart from regular options that a telephone can make, NAVAN has advanced features like voice-mail, auto attendant, web based management and a lot more.
Internet access	Multiple connectivity options supporting Ethernet, 3G/high-speed packet access (HSPA), embedded modules and USB modems ensure seamless connectivity for the business.
Work-place mobility	This feature enhances wireless voice and data access anywhere in the office with the help of built-in Wi-Fi connectivity. People can access the Internet, make/receive calls using VoIP/GSM/plain old telephone service (POTS) lines, and share instant messaging and network based presence from their laptops, mobile phones or tablets.
Data networking	The need of an external data router is completely eliminated by smart routing features like port forwarding/triggering, network address translation (NAT)/session traversal utilities for NAT (STUN), dynamic host configuration protocol (DHCP) server, static route and quality of service (QoS). The built-in Wi-Fi access point and eight-port Ethernet consolidates the wired and wireless networks together.
GSM/3G connectivity	Calls, SMSes and data access using mobile phones, laptops and personal digital assistants (PDAs) can be made using this feature.
VPN	VPN is no more considered a luxury but an absolute necessity for businesses. It allows secured access to business applications and information to the central office and remote workers. NAVAN enables creating a VPN in the most common standards, such as point-to-point tunneling protocol (PPTP), layer 2 tunneling protocol (L2TP), secure sockets layer (SSLs) and Internet protocol security (IPSEC).
Mobile softphone for Android/iPhone	The specialised mobile softphone application in NAVAN helps the user turn any iPhone/Android phone into an office extension. It allows him or her to access advanced call-management features, such as dial-by-extension, caller ID, call-hold, transfer, and conferencing and voice-mail on-the-go.
Flexible phone options	This feature helps users stay connected with business operations with the help of devices of their choice.

Inner view of NAVAN CNX200

modules have been designed to be as compact as possible. The use of no moving parts and a fan-less design has increased the device's reliability with minimum downtime.

Compact form-factor. The compact product structure or the placement of parts is designed in such a way that the real estate is saved greatly. Usage of advanced miniature components and parts, and multi-layer PCB design, also helped make the product more compact. The product is compatible enough with any type of installation scenario, including wall mounts, table-tops or rack-mounts.

DSP based architecture. NAVAN is built with proven DSP based architecture for DTMF generation and detection, CLI detection, better handling of Jitter buffer, VAD, CNG and VoIP transcoding, which results in high reliability and performance at par with world-class technology standards.

NAVAN till date

It took almost one year for this idea to materialise into a product. During this period the changing market dynamics led to a lot of inclusions in areas of technology and product features. At the initial launch of this product, NAVAN CNX200 was recognised by TMC-Net in ITEXPO'13, Miami, as 'best wireless and mobile solution.' NAVAN has enabled Matrix and its channel partners to explore new industries and business opportunities.

What to expect in future

NAVAN is a product that undergoes continuous improvement, providing new features and solutions to customers. Recently-incorporated features are e-mail-to-SMS conversion and CTI. "We also have plans to include load-balancing and multi WAN features, which are generally available in high-end UTM appliances," explains Dhaval Bhagora, marketing manager, Matrix Comsec. The team at Matrix Comsec is determined to bring out more value from the same product in the near future. ●
