

## MARKET SURVEY:

# LED Market Could Grow Manifold in Next 15 Years

Sneha Ambastha is a technical journalist at EFY

A few years ago we did not consider LED lights as a viable option, but today the scenario has changed. The price of LED lights has come down, awareness has increased and the quality of lights has also improved. Till last year we considered price of the light as the only important factor while making a purchase. Today, we want a quality product without compromising on price.

The LED Expo 2014 held recently in New Delhi provided a lot of exposure when it came to new technology and completely indigenous products. Prime Minister Narendra Modi's Make in India concept seems to have had a lot of influence on the LED market, as the expo featured many indigenous products. Some manufacturers had assembled complete lighting systems by outsourcing the raw

materials from abroad and manufacturing the fixtures in-house. However, there were others who had manufactured everything in-house, starting from modules to the lights, following all procedures, like die-casting, in-house at their manufacturing units.

## Diversity in the market

There is a lot of diversification in India when it comes to the LED market today. Companies from automotive industry, random access memory (RAM) manufacturing industry and many more are moving into LED lights business. According to Sumeet Verma, general manager, research and development, Dixon, the LED expo this year did not have any new products, but there were others who found a lot of new components that could help in the growth of this sector in the country. Let us take a look at some of these.

**Dimmable lights.** The kind of lights that most of us have been using till now are the ones with fixed luminosity. But the trend is changing with the advent of LED lights. Today, we have dimmers installed in LED lights. These help adjust the brightness from ten per cent to 100 per cent without any stroboscopic effect.

To explain it better, let us consider an example. If the actual power of the lamp and the lantern is 10W, then its brightness can be adjusted by running it with 1W to 10W, and there would be no aliasing or shadowed-image effect, as in case of other lights when intensity is increased or decreased.

Although dimmable lights do not require any special wiring, these have a rotary dimmer switch installed through the power supply to adjust brightness. In such cases, one dimmer switch can control more than one lamp at a time for multiple spaces.

**Intelligent solar-charge controllers.** The name explains it all. It is a microcon-

Architectural wall lights
