IDC connector

FCI's new Gripet connector offers a robust solution for miniature IDC wire-to-board connections. The low-profile and compact design makes it an ideal connector where space is tight and ease-of-installation is important. Each connector has a

height of 3.7mm and a footprint of 4.0x6.1mm. Specially designed for a stackable pitch up to 12 positions, common housings are available to secure and protect terminated components. It provides a highly-reliable connection, and is suitable in harsh and industrial market applications where direct connection between individual wires and PCB are required.

SoC for water meter

A key feature of a modern ultrasonic water meter is measuring electronics. It runs measurements and transmits data to an external microcontroller. The new system-on-chip (SoC) TDC-GP30, from ACAM MESSE-

ELECTRONIC GMBH (Germany), has been designed specifically for that purpose and follows its predecessor TDC-GP22. The new GP30 is currently available as a Beta prototype and will soon be available in its final version this year.

Silicon-carbide diodes

STMicroelectronics has revealed new automotive-qualified silicon-carbide (SiC) diodes for advanced on-board battery chargers (OBCs) in electric vehicles such as plug-in hybrids (PHEVs) that demand high power-handling capability within a confined space. These diodes allow designers to build smaller power modules, which are good for automotive applications. These employ advanced technology to prevent high-current spikes from damaging the device.

ST's new SiC diodes are automotive-qualified, and feature increased reverse-breakdown voltage of 650V, satisfying voltage derating factors applied by designers and car manufacturers to ensure suitable safety margin between normal and short-term peak voltages across semiconductors used in OBC.

Motor drivers

Texas Instruments has expanded its motor driver portfolio with a new 12V motor driver family that reduces spin-up time to just seconds and makes tuning stepper and brushed DC motors easier than ever before. The DRV8846 incorporates a new, proprietary adaptive current control technology that automatically tunes motor performance for precise, smooth and quiet mo-

tion. The DRV8846 simplifies designs by using a simple pulse-width modulation (PWM) control interface and minimal external components.

Key features and benefits of the DRV8846 and DRV8848 are:

Zero tuning effort. Adaptive current regulation, available on DRV8846, dynamically changes current regulation schemes according to load conditions, with no configuration required. This simplifies system-level tuning and debugging, which allows end equipment manufacturers to get their products to market more quickly.

Smooth, quiet motion. DRV8846's 1/32 micro-stepping indexer, coupled with adaptive current regulation, provides minimal current ripple, which enables smooth, precise motion profiles and reduced acoustic noise.

High integration. The DRV8848 can operate without current sense resistors, leaving supply decoupling capacitors as the only external components required for operation. More precise motor operation can be achieved by including resistors and enabling on-chip current regulation.

Full-fault protection. Advanced on-chip protection, including over-current protection, thermal shutdown, under-voltage lockout and diagnostics with fault condition feedback, protect both the motor driver and motor, reducing design complexity and increasing system reliability.
