

Internet of Things, Made in India

Janani Gopalakrishnan Vikram is a technically-qualified freelance writer, editor and hands-on mom based in Chennai

Far from the days of racing to catch-up with technologies, an era has now dawned where Indian start-ups are forerunners in trendy fields like the Internet of Things (IoT) and Big Data.

Start-up companies are not just important but essential to the growth of a nascent technology. These play a very unique role in the ecosystem, bringing in fresh, new ideas and radical perspectives. Listed in this feature are ten interesting Indian start-ups in the IoT and Big Data space.

SenzIT

(<http://www.senzit.net/smarter-solutions/smarter-justice/>)

Enterprise solution provider SenzIT is working with IBM to transform the courtroom, a place that has defied the pace of modernisation in most countries. By digitally recording the whole sequence of events, right from the start of a case to the announcement of the verdict, and correlating those events with news and relevant videos gathered from here and there, SenzIT would try to ensure a fair and transparent trial. The solution will involve IoT devices, analysis of large amounts of data on a cloud platform, facial recognition and other advanced technologies.

Algo Engines

(<http://algoengines.com/>)

By harnessing the power of IoT and Big Data, Algo Engines provides opera-

tional intelligence to wind turbines, met masts and solar plants. In simple terms, it collates large amounts of data collected by sensors embedded in such power-generating systems and converts them into actionable insights. By immediately remedying faults or changing settings based on environmental changes, the efficiency and effectiveness of these devices can be maximised. However, one must not underestimate the amount of data that needs to be analysed. Considering that hundreds of wind turbines would be flashing updates three times per second to the control centre, it is nothing short of very big data.

Altizon Systems

(<http://altizon.com/>)

Pune based start-up Altizon Systems is a serious player in the industrial Internet space. Their scalable Datonis platform includes sensor data appliances and software development tools, which manufacturers can use to build connected industrial equipment that constantly feed operational data to a cloud based platform for aggregation and analysis. A few original equipment manufacturers (OEMs) are already using the solution to improve operational efficiency, remote monitoring and predictive maintenance.

Azoi

(<https://azoi.com>)

Although registered in the USA, Azoi is an Indian company. Founded several years back by two friends, the Gujarat based start-up continued to fiddle with futuristic technologies like gesture-recognition till they hit bull's eye with their latest product, Wello.

Wello is a health tracker disguised as a mobile phone case. Whenever you hold the case, its sensors measure vital parameters and pass on the figures to a smartphone app, which not only monitors your health
