

How you can use IoT

Commercial products are the tangible face of technology, the aspect that common people can easily understand, and of course use. And, in that dimension, IoT is doing really well. From trendy wearables to smart energy savers, there is a vast variety of exciting IoT products available in the market these days, making it a popular shopping category this holiday season.

In previous issues of Electronics for You, we have frequently covered trendsetters in this space, including Nest Labs' smart (now self-learning) thermostat and smoke alarm, Belkin's WeMo range of home-automation products, smart lights such as Phillips Hue and Lix, smart watches like Pebble, and fitness aids like Fitbit, FuelBand, Jawbone Up, and so on. Let us now take a quick look at more such exciting IoT products.

Neurio

(<https://www.neurio.io/>)

Neurio is a smart device that can infer a lot of things from your power-consumption pattern. When you install the Wi-Fi-enabled Neuroio sensor in your power meter panel, its current transformers keep measuring the flow of electricity into your home. This usage information is transmitted to Neuroio cloud, wherein your home's power data is stored and constantly analysed. By monitoring the variations in energy consumption, Neuroio can make useful inferences like when your dryer has finished its job or if you forgot to turn-off the air-conditioner, and notify you through SMS. The team is working to enable

more customisation through if-this-then-that (IFTTT) programmability.

Lively

(<http://www.mylively.com/>)

The next best thing to being with the elders of your family is at least knowing constantly that they are well and assuring them of immediate help in emergencies. Packaged as an easy-to-setup-and-use smart watch, Lively literally stays with the users, making sure they are fine. It reminds them to take their medicines, watches if they are as active as always, and alerts concerned people, when required. It has a one-touch help button, which sets Lively care team into action. The personnel stay on the line, constantly talking to the senior citizen till help arrives. For use at home and within 457m (1500-feet) of

status but also identifies patterns that can help improve your lifestyle.

Cooley

(<http://cooley.co.in/>)

Another Indian healthcare wearable, Cooley, constantly monitors health parameters like temperature,

heart rate, detailed weight break-up (fat, muscle, etc) and more. It obtrusively monitors the health of kids, elders or anybody else, and alerts their guardians in times of need. Although there are many international products in this genre, what could make Cooley a better choice for Indians is the localised ambulatory care provided in emergencies.

CarIQ

(<http://mycariq.com/>)

CarIQ is India's answer to smart cars. Work on

CarIQ started in 2012, following the team's realisation that people make very smart decisions till the point of purchase, comparing various car brands, models and technologies. However, after the purchase, they flounder in decisions ranging from service, maintenance and security to the actual driving of the car.

CarIQ platform, now available for pre-order, aims to connect a car to the cloud, enabling both the driver and the car itself to make smart decisions based on real-time data. Basically, data derived from the car's microcomputer is passed on to cloud based servers, where it is analysed to generate insights about the condition of the car, credibility of the driver,
