

it, the device does not require a smartphone, as it connects using a Lively hub. For outside use, it is paired with a smartphone app.

ToyMail

(<http://www.toymail.co/>)

IoT has something for everybody, from elders to kids. ToyMail is a service that combines an attractive mailman toy with a ToyMail app. When you are away at work and want to connect with your kid, you can record a voice message, which will be conveyed to your child by the mailman toy. The kid's childish reply also comes back to you, recorded by the mailman and delivered on your smartphone, just in time to make your day. There is also a service that delivers personalised daily messages to your child, with interesting thoughts, stories, news or something else that would be of interest to that age group.

RainMachine

(<http://www.rainmachine.com/>)

This IoT tool helps you connect with the weather, to save water and even your crops. This Wi-Fi-enabled touch-screen device sits in your garden or farm and connects with National Oceanic and Atmospheric Administration, which manages numerous satellites, radars and weather stations, to bring you the best weather forecasts. With a six-hourly weather update and extremely-accurate EvapoTranspiration calculations, it manages the watering needs of your garden or farm.

When the Internet is down or there is no forecast information available, RainMachine quickly switches to historical data to help in its watering plans. You can remotely manage RainMachine using a smartphone app. Garden

fuel efficiency and so on. CarIQ platform will also assist businesses in delivering high-value personalised services, such as emergency response, to car owners.

Altixx

(<http://www.altixx.com/>)

Founded in 2013, Altixx offers product engineering services spanning segments like mobile, embedded and other technologies. On the IoT front, they offer a toolkit for speedy development and deployment of machine-to-machine (M2M) applications. The toolkit includes connectivity middleware components (BoxPWR), a management platform (Internet of Things and Everything

Else) and an intelligence framework (IoTelligence).

tagPlug

(<http://www.tagplug.com/>)

A power-saving tool that is made for India. Basically, tagPlug is an easy-to-plug-in device that can replace any switch in your house. All you need to do is plug the device in, install and configure the app, and you are ready to remotely control that switch. You can turn your lights on or off when you enter or leave the house, program it to automatically switch-off once your phone is charged, set on/off times and more. You can pre-order the product from their website.

IoT Inside...

The tangible and functional IoT product you use, whether a smart watch, energy monitor or motion sensor, is an amalgamation of many technologies and services. Here are the main components:

- > An embedded system inside the product
- > If required, one or more sensors that make the product aware of its environment
- > A unique internet protocol (IP) address, which identifies the device on the Internet
- > Wireless capability to connect to the Internet, directly or through a gateway
- > A backend platform, usually cloud based, which collates Big Data collected by these devices and packages it into a value-added service
- > A smartphone app that connects you, the device and the cloud platform

management is emerging as a popular segment in IoT and there are other products like Fliwer and Iro in this space.

Owlet baby

(<https://www.owletcare.com/>)

No equipment can ever be completely comfortable for a baby, but this is as comfortable as medical tests can get. Owlet is a snug-fitting shoe that constantly monitors your baby's vital signs, including heart rate, oxygen level, temperature and sleep quality, and issues an alert when parameters are abnormal. It optionally transmits the information to a smartphone app for analysis by caretakers, doctors or parents.

Natalia project

(<http://natalia.civilrightsdefenders.org/>)

Even though this IoT gadget is a work-in-progress,

Transpose India

(<http://transposeindia.strikingly.com/>)

Transpose India, a start-up born out of CEPT University, Ahmadabad, aims to use data to sort out endless traffic problems in India. The team at Transpose India believes that proper collection and analysis of data, about not just the number of commuters but also the environmental behaviour at various times of the day, can help ease the traffic even in places where it is generally thought that widening of roads is the only solution.

Transpose has developed an assembly of components to develop economical, portable and intelligent
