

Selecting 3D Television Made Easy

Diksha Gupta is senior assistant editor at EFM

3D technology has entered into our lives smoothly with 3D televisions. Almost all big names in the world of consumer electronics have recognised the power of 3D technology and come up with 3D televisions. Whether Plasma, LCD/LED, 3D televisions have managed to grab eyeballs.

3D experience is enriched when viewed on a huge screen. Before investing in a 3D television, it is advisable that you learn about the little nuances.

3D technologies

There are different 3D technologies that can be used to achieve 3D effect.

Anaglyph technology. This technology works with glasses of different colour tints. Images for both eyes are displayed simultaneously and are skewed in such a way that these are relative to each other. Each eye sees the image in colours that cannot pass through the tinted glass of the other eye. This results in each eye seeing a unique image that gives a 3D impression.

Active shutter glasses based 3D displays. Active shutter glasses come with polarisation filters and liquid crystals. If a small voltage is applied, these can turn the glass dark. Voltage is applied at the rate of 120 times per second, that is, 120Hz, allowing each eye-glass to

alternate between being transparent or dark. This facilitates the image to pass to the viewer's eye. The glasses work in sync with the 3D television in such a way that only the left eye-glass is transparent when the frame for the left eye-glass is displayed, and vice-versa.

Passive polarised 3D displays. A lot of movie theatres use passive polarised 3D displays. These display two images on the screen simultaneously, where each image has a different polarisation. What is interesting about this technology is that the 3D glasses used to view the image are regular glasses with a polarised filter on each eyepiece. Each eye receives a single image courtesy the difference in polarisation for each eye and polarisation for two images on 3D display.

Glass-less 3D televisions. Many companies have come up with prototypes of glass-less 3D televisions, but several limitations have been observed in them, including lower screen resolution as compared to regular LCD or plasma 3D televisions and restrictive viewing angle. It might be a while before this 3D technology matures.

How to choose your 3D television

Now that you are familiar with 3D technologies available in the market, here is our guide to help you make the most informed

SOME 101.6CM (40-INCH) OR ABOVE 3D TELEVISIONS AVAILABLE IN INDIA

	LG 47LB6500 119cm (47-inch) LED TV	Samsung 40HG400 101cm (40-inch) LED TV	Vu 65XT800 165cm (65-inch) LED TV	Sony BRAVIA KDL-46W950A 116cm (46-inch) LED TV
				
Price	₹ 103,900	₹ 73,500	₹ 250,000	₹ 107,900
Features worth looking at	Full HD display with 1920 x 1080 resolution, built-in Wi-Fi	You can change channels, adjust the volume, switch the television off and more with basic spoken commands.	4K display with 3840 x 2160 resolution	It gives you a choice of 3D television broadcasts and 3D web videos, while letting you watch movies on your Blu-ray disk.

The prices mentioned here are from various e-commerce portals and are subject to change.
